Childhood Obesity Resource
Introduction

Project Background
This project was made possible through a grant from Covidien. The Obesity Society partnered with the National Association of Community Health Centers (NACHC) to develop a resource that would provide the basis for a toolkit for Community Health Centers (CHCs) with information on childhood obesity treatment and prevention for providers, patients, families, and community stakeholders. This is the Beta version of the kit that will be used to evaluate its effectiveness in the community and in selected Community Health Centers.

About Childhood Obesity
In the past 30 years, the occurrence of overweight in children has doubled and it is now estimated that one in five children in the US is overweight. Increases in the prevalence of overweight are also being seen in younger children, including preschoolers. Prevalence of overweight is especially higher among certain populations such as Hispanic, African American and Native Americans where some studies indicate prevalence of >85th percentile of 35-40%. Also, while more children are becoming overweight, the heaviest children are getting even heavier. As a result, childhood overweight is regarded as the most common prevalent nutritional disorder of US children and adolescents, and one of the most common problems seen by pediatricians.

About Community Health Centers
The National Association of Community Health Centers was formed by and for community-based health center programs. NACHC programs and services are designed to assist health centers in navigating today’s complex and constantly changing health care environment.

Spread across 50 states and all U.S. territories, there are 1,250 Community Health Centers that provide vital primary care to 20 million Americans with limited financial resources.

Directed by boards with majority consumer membership, health centers focus on meeting the basic health care needs of their individual communities. Health centers maintain an open-door policy, providing treatment regardless of an individual’s income or insurance coverage.

Health centers serve the homeless, residents of public housing, migrant farm workers and others with emergent and chronic health care needs, but limited resources to secure treatment through traditional channels.

Health centers provide substantial benefits to their communities:

- They serve 20% of low-income, uninsured people.
- 70% of their patients live in poverty.
- They provide comprehensive care, including physical, mental and dental care.
- They save the national health care system between $9.9 billion and $17.6 billion a year by helping patients avoid emergency rooms and making better use of preventive services.
Table of Contents

Section 1: Clinical Assessment, Evaluation, and Diagnosis

BMI Charts/Information
1 1 to 20 years: Boys—Body mass index-for-age percentiles
2 1 to 20 years: Girls—Body mass index-for-age percentiles
3 The Preventive Health Visit—How to calculate, plot, and track BMI and BMI percentile for pediatric patients
4 Medical Screening by BMI Category

Blood Pressure Charts/Information
6 Blood pressure levels for the 90th and 95th percentiles of blood pressure for boys ages 1 to 17 by percentiles of height
7 Blood pressure levels for the 90th and 95th percentiles of blood pressure for girls ages 1 to 17 by percentiles of height
8 Definition of hypertension and clinical evaluation of confirmed hypertension
9 Hypertension Management Algorithm

Patient/Family Questionnaires and Assessments
11 Survey for all patients (ages 2–8) at well-child visits
12 Survey for all patients (ages 9–18) at well-child visits
13 Healthy Habits Survey (ages 2–9)
14 Health Habits Survey (ages 10 and older)
15 In-depth Nutrition Survey
16 In-depth Physical Activity Survey
20 Obesity Assessment: Physical Examination Findings and Possible Etiologies
21 Obesity Assessment: Findings on Review of Systems and Possible Etiologies

Section 2: Treatment Strategies

Weight Management Algorithms
23 Universal Assessment of Obesity Risk: Steps to Prevention and Treatment

The Preventive Health Visit—How to Calculate, Plot, and Track BMI and BMI Percentile for Pediatric Patients

The well-child visit is the ideal time to address issues of healthy eating and physical activity as well as provide counseling on issues of healthy weight, physical activity and ways the family can strengthen their support for their child’s healthy weight.

The first step in this process is the calculation of the Body Mass Index (BMI). The American Academy of Pediatrics recommends the BMI be calculated on a yearly basis for children 2 years and older.

BMI is calculated as follows:

<table>
<thead>
<tr>
<th>Weight in kilograms (kg) divided by the square of height in meters (m²).</th>
<th>Weight in pounds (lbs) divided by the square of height in inches (in²) multiplied by 703.</th>
</tr>
</thead>
<tbody>
<tr>
<td>BMI = ( \frac{\text{Weight (kg)}}{\text{Height squared (m²)}} )</td>
<td>BMI = ( \frac{\text{Weight (lbs)}}{\text{Height squared (in²)}} \times 703 )</td>
</tr>
</tbody>
</table>

There are numerous methods available for calculating BMI:

- Mathematical formula (see above)
- BMI Wheel Calculator
  - Align weight and height values. Read BMI in the windows at the bottom of the wheel. If weight or height exceeds child limits, use the adult side of the BMI wheel. (This is a great resource for clinical staff to use. It is also great for physician offices without internet access.)
- Online BMI Calculator
- PDA software program

Calculating, Plotting, and Tracking BMI and BMI Percentile

Four steps should be followed to ensure accurate tracking of BMI:

1. Accurately measure weight and height.
2. Calculate BMI using one of the methods listed above.
3. Plot BMI for age and sex on the CDC BMI Growth Charts (see pages 6–7) to determine the patient’s BMI percentile.
4. Record BMI and BMI percentile in the patient’s chart.
The Preventive Health Visit—How to Calculate, Plot, and Track BMI and BMI Percentile for Pediatric Patients (continued)

Sample Calculation
Charles is a 10-year-old boy who is 4’7” tall and weighs 100 pounds. What is Charles’ BMI?

\[ \text{BMI} = \frac{\text{weight [lbs]}}{\text{height (inches)}^2} \times 703 \]

\[ \text{BMI} = \frac{100}{55^2} \times 703 \]

\[ \text{BMI} = 23.2 \]

What does a BMI of 23.2 for Charles represent?

According to the Centers for Disease Control and Prevention’s gender and age specific charts for BMI (see pages 15 and 16), Charles’ BMI is greater than the 95th percentile. Therefore, Charles is obese.

</table>

Abbreviations: BMI, body mass index; BP, blood pressure; ALT, alanine transaminase; AST, aspartate transaminase; BUN, blood urea nitrogen.

*BMI is a screening measure. The higher the BMI, the more likely it is to be correlated with excess fat.

*Risk factors include family history of obesity-related diseases, including hypertension, early cardiovascular deaths, and strokes, elevated blood pressure (in the patient), hyperlipidemia, and tobacco use.

*Blood pressure percentile determined by a single measurement.

Source: Reprinted from National High Blood Pressure Education Program Working Group on Hypertension Control in Children and Adolescents. Appears in The Childhood Obesity Toolkit developed by NICHQ, the National Initiative for Children’s Healthcare Quality, and the teams from NICHQ’s Learning Collaboratives: Healthy Care for Healthy Kids, a Collaborative to Prevent, Identify and Manage Childhood Overweight, sponsored by Blue Cross Blue Shield MA.
## Definition of Hypertension and Clinical Evaluation of Confirmed Hypertension

- Hypertension is defined as average SBP and/or DBP that is ≥95th percentile for gender, age, and height on ≥3 occasions.
- Prehypertension in children is defined as average SBP or DBP levels that are ≥90th percentile but <95th percentile.
- As with adults, adolescents with BP levels 120/80 mm Hg should be considered prehypertensive.
- A patient with BP levels >95th percentile in a physician’s office or clinic, who is normotensive outside a clinical setting, has “whitecoat hypertension.” ABPM is usually required to make this diagnosis.

## Clinical Evaluation of Confirmed Hypertension

**Abbreviations:** SBP, systolic blood pressure; DBP, diastolic blood pressure; BP, blood pressure; ABPM, ambulatory blood pressure monitoring; BUN, blood urea nitrogen; R/O, rule out; CBC, complete blood count; U/S, ultrasound; CVD, cardiovascular disease; LVH, left ventricular hypertrophy; MRA, magnetic resonance angiography; CT, computed tomography; DSA, digital-subtraction angiography.

bComorbid risk factors also include diabetes mellitus and kidney disease.
Therapeutic Lifestyle Changes

- Weight reduction is the primary therapy for obesity-related hypertension. Prevention of excess or abnormal weight gain will limit future increases in blood pressure.

- Regular physical activity and restriction of sedentary activity will improve efforts at weight management and may prevent an excess increase in blood pressure over time.

- Dietary modification should be strongly encouraged in children and adolescents who have blood pressure levels in the prehypertensive range as well as those with hypertension.

- Family-based intervention improves success.

Indications for Antihypertensive Drug Therapy in Children

- Symptomatic hypertension

- Secondary hypertension

- Hypertensive target-organ damage

- Diabetes (types 1 and 2)

- Persistent hypertension despite nonpharmacologic measures
Survey for All Patients (Ages 2–8) at Well-Child Visits

In our office, we are interested in providing the best care to our patients. This includes discussing with all our patients, steps that you can take to improve your family’s health. While you are waiting to see your provider, it would be helpful if you would please take a few moments with your child to answer the following questions. Your healthcare provider will go over your answers during your visit. We understand how difficult it is to follow healthy lifestyle recommendations. The questions below will help us discuss how you might best start to make small changes to improve your family’s health.

Name ________________________________________ Age _________ Date __________

Yes No

5 My child eats fruits and vegetables 5 or more times on most days. □ □
My child eats breakfast every day. □ □
My child eats dinner at the table with the family at least 2 times per week. □ □
My child eats take-out (takeout, fast food places, restaurants) less than 2 times per week. □ □

2 My child watches TV, videos or plays computer games less than 2 hours per day. □ □
My child does not have a TV in the bedroom. □ □

1 My child participates in some type of moderate physical activity for at least 1 hour every day. □ □

0 My child does not regularly drink fruit-drinks, sports drinks, soda or punch. □ □
My child drinks fat-free/skim or 1% rather than 2% or whole milk. □ □

Healthy Habits Survey (Ages 2–9)

We are interested in the health and well-being of all our patients. Please take a moment to answer the following questions.

Name ___________________________ Age ________ Date ______________

- How many servings of fruits or vegetables does your child eat a day? *One serving is most easily identified as the size of your child’s palm.*

- How many times a week does your child eat dinner at the table with the family?

- How many times a week does your child eat breakfast?

- How many times a week does your child eat takeout or fast food?

- How many hours a day does your child watch TV, movies, DVD’s or sit and play video/computer games?

- Does your child have a TV in the room where he/she sleeps?  □ Yes □ No

- Does your child have a computer in the room where he/she sleeps? □ Yes □ No

- How many hours a day does your child spend in active play? *(Faster breathing/heart rate or sweating)*

- How many 8 ounce servings of the following does your child drink a day?
  - 100% Juice ________
  - Fruit drinks or sports drink ________
  - Water ________
  - Whole milk ________
  - Soda or punch ________
  - Fat-free or reduced fat milk ________

Based on your answers, is there ONE thing you would like to help your child change now?

- □ Spend less time watching TV, sitting & playing video/computer games.
- □ Eat more fruits & vegetables.  □ Drink less soda, juice, or punch.
- □ Switch to skim or low-fat milk.  □ Take the TV and or computer out of the bedroom.
- □ Drink more water.  □ Play outside more often.
- □ Eat less fast food/takeout.  □ Eat breakfast everyday.

Please give the completed form to your clinician. Thank you.

In-Depth Nutrition Survey (continued)

**Parent Questions:**

Are meals eaten at the table as a family?  
☐ Yes  ☐ No

Are children expected to prepare some of their own meals?  
☐ Yes  ☐ No

Are fruits and vegetables easily accessible to kids?  
☐ Yes  ☐ No

Do you eat fruits and vegetables?  
☐ Yes  ☐ No

Do you dish out your child’s portions?  
☐ Yes  ☐ No

Are you concerned about your child’s weight?  
☐ Yes  ☐ No

Do you always have enough money to buy food?  
☐ Yes  ☐ No

Are there any issues related to your child’s food habits or diet that you’d like to talk about?

**Patient Questions:**

Do you try to be the first one done with your meal?  
☐ Yes  ☐ No

Do you try to eat more than your siblings?  
☐ Yes  ☐ No

Do you get up at night to eat?  
☐ Yes  ☐ No

Do you eat when you are upset?  
☐ Yes  ☐ No

Do you keep food in your room?  
☐ Yes  ☐ No

Do you trade foods at school from your lunch?  
☐ Yes  ☐ No

List all fruits and vegetables that you like to eat.

What are your favorite foods?

# In-Depth Physical Activity Survey

Name ______________________________ Age _______ Date ________________

How many hours per day do you usually watch TV and/or play video/computer games?
- Weekdays _______ Weekend _______

How often outside of gym class are you so active playing, exercising, or in sports, that your heart beats fast and you breathe hard for 20 minutes or more at a time? (Check the one that applies)
- ☐ Every day
- ☐ 5–6 days each week
- ☐ 3–4 days each week
- ☐ 1–2 days each week
- ☐ Less than 2 days per week

What activities do you generally participate in at school and outside of school? (i.e. sports teams, classes, lessons)

<table>
<thead>
<tr>
<th>Activity</th>
<th>At School</th>
<th>Outside of School</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td></td>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td></td>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td></td>
<td>☐</td>
<td>☐</td>
</tr>
<tr>
<td></td>
<td>☐</td>
<td>☐</td>
</tr>
</tbody>
</table>

Which of the following items do you have in your home, yard, or apartment complex? (Please check all those that apply)

- ☐ Stationary exercise equipment (treadmill, cycle, etc.)
- ☐ Step or slide aerobic
- ☐ Ice skates
- ☐ Rollorblades and/or roller-skates
- ☐ Sports equipment (racquets, balls, etc.)
- ☐ Canoe, row boat, kayak
- ☐ Skis (snow or water)
- ☐ Swimming or scuba equipment
- ☐ Bike
- ☐ Dog
- ☐ Trampoline
- ☐ Running shoes/sneakers
- ☐ Swimming pool
- ☐ Weight lifting equipment
- ☐ Aerobic workout videos or audio tapes
In-Depth Physical Activity Survey (continued)

Do any of the following prevent you from exercising? (Please check all those that apply)

- Self conscious about my looks when I do activities
- Lack of interest in physical activity
- Lack of self discipline (will power)
- Lack of time
- Lack of energy
- My friends don’t like to exercise
- I do not enjoy physical activity
- Lack of equipment
- The weather is too bad
- Lack of skills
- I am too tired to exercise
- I do not have anyone to do physical activities with me
- Lack of a convenient place to do physical activity
- I am too heavy
- Physical activity is boring
- My friends tease me during exercise or sports
- Lack of knowledge on how to do physical activities
- I am chosen last for teams
- I don’t like to sweat
- Physical activity messes up my appearance
- I don’t want to get too strong or muscular
- Homework

Please check off any of the following that get in the way of you being physically active:

- At home there aren’t enough supplies and pieces of sports equipment (like balls, bicycles, & skates) to use for physical activity.
- There are no playgrounds, parks, or gyms close to my home or that I can easily get to.
- It is not safe to walk or jog alone in my neighborhood during the day.
- It is difficult to walk or jog in my neighborhood because of things like traffic, no sidewalks, dogs, and so on.
- Other? Please explain:

Section 2

Treatment Strategies
### Universal Assessment of Obesity Risk: Steps to Prevention and Treatment

#### Section 2 Treatment Strategies

**Weight Management Algorithms**

<table>
<thead>
<tr>
<th>Identification</th>
<th>Assessment</th>
<th>Prevention</th>
</tr>
</thead>
</table>
| **BMI 5th–84th percentile** | • Patient history  
• Patient growth  
• Parental obesity  
• Family history | • Medical Risk  
• Behavior Risk  
• Attitudes |
| **BMI 85th–94th percentile** | • Sedentary time  
• Eating  
• Physical activity | • Family and patient concern and motivation |
| **BMI ≥95th percentile** | • Laboratory, as needed | • Target behavior  
• Patient/family counseling |

- **Identification**
  - Calculate and plot BMI at every well-child visit.

- **Assessment**
  - Medical Risk
  - Behavior Risk
  - Attitudes
  - • Patient history  
  - • Patient growth  
  - • Parental obesity  
  - • Family history  
  - • Laboratory, as needed

- **Prevention**
  - Target behavior
  - Patient/family counseling
  - • Identify problem behaviors
  - • If no problem behaviors, praise current practice
  - • Review any risks
  - • Use patient-directed techniques to encourage behavior change

**Intervention for Treatment**

(Advance through stages based on age and BMI.)

- **Stage 1 Prevention Plus**
- **Stage 2 Structured Weight Management**
- **Stage 3 Comprehensive Multidisciplinary Intervention**
- **Stage 4 Tertiary Care Intervention (select patients)**

**Abbreviation:** BMI, body mass index.

See breakdown of stages on pages 26–27.
### Universal Assessment of Obesity Risk: Steps to Prevention and Treatment (continued)

#### Stage 1
**Prevention Plus**

**Primary Care Provider**

**Dietary habits and physical activity**
- **5** Eat fruits and vegetables at least 5 or more times on most days.
- **2** Limit screen time unrelated to school to 2 hours or less daily.
- **1** Get 1 hour or more of moderate to vigorous physical activity every day and 20 minutes of vigorous activity at least 3 times a week.
- **0** Drink less sugar. Try water and low-fat milk instead of sugar-sweetened drinks.

**Behavioral Counseling**
- Eating a daily breakfast
- Limiting meals outside the home
- Family meals 5–6 times/week
- Allow child to self-regulate at meals without overly restrictive behavior

**Goal**
- Weight maintenance with growth resulting in decreased BMI

**Monthly follow-up assessment. After 3–6 months, if no improvement in BMI/weight status, advance to Stage 2.**

---

#### Stage 2
**Structured Weight Management**

**Primary Care Provider with appropriate training**

**Dietary habits and physical activity**
- Develop plan for utilization of balanced macronutrient diet emphasizing low amounts of energy-dense foods
- Increased structured daily meals and snacks
- Supervised active play of at least 60 minutes/day
- Screen time of 1 hour or less/day
- Increased monitoring (e.g., screen time, physical activity, dietary intake, restaurant logs) by provider, patient, and/or family

**Goal**
- Weight maintenance resulting in a decreasing BMI with age and increasing height. Weight loss not to exceed 1lb/month in children 2–11 years or an average of 2 lbs/week in older overweight/obese children and adolescents

**Monthly follow-up assessment. If no improvement in BMI/weight after 3–6 months, patient should be advanced to Stage 3.**
Universal Assessment of Obesity Risk: Steps to Prevention and Treatment (continued)

### Stage 3
**Comprehensive Multidisciplinary Intervention**

**Weight Management Clinic with multidisciplinary team**

**Eating and Activity**
- Same as Stage 2

**Behavioral counseling**
- Structured behavioral modification program, including food and activity monitoring and development of short-term diet and physical activity goals
- Involvement of primary caregivers/families for behavioral modification in children younger than 12 years and training of primary caregivers/families for all children

**Goals**
- Weight maintenance or gradual weight loss until BMI <85% not to exceed 1 lb/month in children aged 2–5 years or 2 lbs/week in older obese children and adolescents

### Hospital Setting with expertise in childhood obesity

Recommended for children with BMI >95% with significant comorbidities unsuccessful with Stages 1–3 and children with BMI >99% who have shown no improvement under Stage 3

- Multidisciplinary team with expertise in childhood obesity operating under a designated protocol
- Continued diet and activity counseling and consideration of such additions as meal replacement, very low calorie diet, medication, and surgery

All Well-Child Visits Ages 3–18 Flowchart

Check-In: Front Desk
Everyone is given the age appropriate 5–2–1–0 survey

Check-In: CNA/MA
Height, weight measured and BMI percentile for age/gender is calculated, classified as underweight, healthy weight, overweight or obese and documented in appropriate part of patient chart

5th–84th percentile age/gender “Healthy Weight”

Provider
GOOD JOB! Reinforce healthy habits (eating & physical activity) and check BMI percentile age/gender annually

85th–94th percentile age/gender “Overweight”

Both with and without comorbidities

Provider
• Review the 5–2–1–0 survey with patient/caretaker and document in chart
• Assess patient/family readiness for change
• Discuss concept of goal setting
• Set goal if appropriate or wait for follow up appointment
• Ask patient to schedule follow up contact on way out

CHOOSE FROM THE FOLLOWING OPTIONS for completion of in-depth physical activity & nutrition surveys

If time left for this appointment, patient fills out in-depth surveys in exam room while PCP tends to other patients. PCP returns to review & set goals.

Patient fills out in-depth surveys in waiting room and leaves for PCP to review during next scheduled visit.

If patient can’t stay to fill out they can either bring in-depth surveys home & mail back to PCP office before next visit or staff can put surveys in chart with note to be completed in waiting room during next visit.

≥95th percentile age/gender “Obese”
Section 2 Treatment Strategies
Weight Management Algorithms

Planned Follow-Up Visit for a Youth Overweight/Obese Patient Ages 3–18 Flowchart

Check-In: Front Desk

<table>
<thead>
<tr>
<th>Has Patient Completed 5-2-1-0 survey?</th>
</tr>
</thead>
<tbody>
<tr>
<td>YES</td>
</tr>
<tr>
<td>Check to see if in-depth physical activity &amp; nutrition surveys are complete, if not give to patient to fill out in waiting room.</td>
</tr>
<tr>
<td>NO</td>
</tr>
<tr>
<td>Have patient complete 5–2–1–0 and in-depth physical activity and nutrition surveys.</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

Check-In: CNA/MA

If BMI not done in previous 3 months recheck BMI percentile age/gender, classify and document in appropriate part of patient chart or EMR.

85th–94th percentile age/gender without comorbidities “Overweight”

Provider

Promote healthy eating & physical activity with:

- 5–2–1–0 messages & review in-depth surveys
- Use Keep ME Healthy Toolkit & patient handouts
- Refer to community/school programs

85th–94th percentile age/gender with comorbidities “Overweight”

Provider

- Review the 5-2-1-0 and in-depth physical activity & nutrition surveys with the patient/family
- Assess patient/family readiness to change
- Discuss goal setting worksheet
- Use Keep ME Healthy Toolkit & patient handouts
- SET GOAL
- Refer to community/school programs and or specialist
  - Recheck in 3 months or as appropriate

≥95th percentile age/gender “Obese”

## 15-Minute Obesity Prevention Protocol

<table>
<thead>
<tr>
<th>Steps</th>
<th>Possible Etiologies</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>STEP 1. ASSESSMENT</strong></td>
<td>We checked your child’s body mass index (BMI), which is a way of looking at weight and taking into consideration how tall someone is. Your child’s BMI is in the range where we start to be concerned about extra weight causing health problems.</td>
</tr>
<tr>
<td>Weight and height, convert to BMI. Provide BMI information.</td>
<td>Elicit parent’s concern.</td>
</tr>
<tr>
<td>Elicit parent’s concern.</td>
<td>What concerns, if any, do you have about your child’s weight? <em>He did jump two sizes this year. Do you think he might get diabetes someday?</em></td>
</tr>
<tr>
<td>Reflect/probe.</td>
<td>So you’ve noticed a big change in his size and you are concerned about diabetes down the road. What makes you concerned about diabetes in particular? Etc.</td>
</tr>
<tr>
<td>Sweetened beverages, fruits and vegetables, TV viewing and other sedentary behavior, frequency of fast-food or restaurant eating, consumption of breakfast, and others.</td>
<td>(Use verbal questions or brief questionnaires to assess key behaviors.) Example: About how many times a day does your child drink soda, sports drinks, or powdered drinks like Kool-Aid?</td>
</tr>
<tr>
<td>Provide positive feedback for behavior(s) in optimal range. Elicit response. Reflect/probe.</td>
<td>You are doing well with sugared drinks. <em>I know it’s not healthy. He used to drink a lot of soda, but now I try to give him water whenever possible. I think we are down to just a few sodas a week.</em></td>
</tr>
<tr>
<td>Provide neutral feedback for behavior(s) NOT in optimal range. Elicit response. Reflect/probe.</td>
<td>Your child watches 4 hours of TV on school days. What do you think about that? <em>I know it’s a lot, but he gets bored otherwise and starts picking an argument with his little sister.</em></td>
</tr>
<tr>
<td><strong>STEP 2. AGENDA SETTING</strong></td>
<td>We’ve talked about eating too often at fast-food restaurants, and how TV viewing is more hours than you’d like. Which of these, if either of them, do you think you and your child could change? <em>Well, I think fast food is somewhere we could do better. I don’t know what he would do if he couldn’t watch TV. Maybe we could cut back on fast food to once a week.</em></td>
</tr>
<tr>
<td>Query which, if any, of the target behaviors parent/child/adolescent may be interested in changing or might be easiest to change.</td>
<td>Agree on possible target behavior.</td>
</tr>
<tr>
<td><strong>STEP 3. ASSESS MOTIVATION AND CONFIDENCE</strong></td>
<td>That sounds like a good plan.</td>
</tr>
<tr>
<td><strong>3a: Willingness/Importance</strong></td>
<td>On a scale of 0 to 10, with 10 being very important, how important is it for you to reduce the amount of fast food he eats?</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>Not at all</td>
<td>Somewhat</td>
</tr>
</tbody>
</table>

*Source: Adapted from the Keep ME Healthy chart developed by the Maine Center for Public Health and the Maine Chapter of the American Academy of Pediatrics (copyright 2006 Maine Center for Public Health). Reproduced with kind permission of the Maine Center for Public Health and the American Association of Pediatrics.*
### 3b: Confidence

On a scale of 0 to 10, with 10 being very confident, assuming you decided to change the amount of fast food he eats, how confident are you that you could succeed?

<table>
<thead>
<tr>
<th>Not at all</th>
<th>Somewhat</th>
<th>Very</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
<td>5</td>
</tr>
<tr>
<td>6</td>
<td>7</td>
<td>8</td>
</tr>
<tr>
<td>9</td>
<td>10</td>
<td></td>
</tr>
</tbody>
</table>

You chose 6. Why did you not choose a lower number?

*I know all that grease is bad for him.*

You chose 6. Why did you not choose a higher number?

*It's quick, cheap, and he loves it...especially the toys and fries.*

**REFLECTION:** So there are benefits for both you and him.

What would it take you to move to an 8?

*Well, I really want him to avoid diabetes. My mother died of diabetes, and it wasn’t pretty...maybe if he started showing signs of it...maybe if I could get into cooking a bit.*

### STEP 4. SUMMARIZE AND PROBE POSSIBLE CHANGES

**Query possible next steps.**

So where does that leave you?

**OR**

From what you mentioned it sounds like eating less fast food may be a good first step.

**OR**

How are you feeling about making a change?

**Probe plan of attack.**

What might be a good first step for you and your child?

**Or**

What might you do in the next week or even day to help move things along?

**Or**

What ideas do you have for making this happen?

*If patient does not have any ideas...*

If it's OK with you, I’d like to suggest a few things that have worked for some of my patients.

**Summarize change plan, provide positive feedback.**

Involving child in cooking or meal preparation. Ordering healthier at fast-food restaurants. Trying some new recipes at home.

### STEP 5. SCHEDULE FOLLOW-UP

**Agree to follow up within X weeks/months.**

Let's schedule a visit in the next few weeks/months to see how things went.

**If no plan is made.**

Sounds like you aren’t quite ready to commit to making any changes now. How about we follow up with this at your child’s next visit?

**OR**

Although you don’t sound ready to make any changes, between now and our next visit you might want to think about your child’s weight gain and lowering his diabetes risk.
Section 3

Healthcare Provider Educational Tools
Tips for Busy Clinicians

Treatment Interventions

Communication

- Deliver a set of consistent key messages—5-2-1-0.
- Keep a list of good websites to give your patients. Have appropriate books and magazines available in your waiting room. Provide books, puzzles, and activity sheets—especially for children—that help promote healthy eating and active living.
- Display educational posters and create a bulletin board for community partners to update.
- Frame your discussions to expand the patient/family perception of what healthy lifestyle changes they can make. Keep goals small, simple, and concrete. Allow for personal choices. Selections a child enjoys will be more easily sustained.
- Have patients set specific behavioral goals and action plans and be sure to ask about these during the next visit or follow-up contact.
- Be aware of the cultural norms of the patient, significance of meals/eating for the family/community, beliefs about special foods, and feelings about body size.

Team Approach

- Be a good role model—be physically active every day and work to make healthy food choices.
- Involve the clinical team in planning and implementing treatment intervention.
- Know your community resources and refer patients to them. These will help support families once they leave your office.
- Behavior change is a long-term process and involving other qualified staff will help ensure success.
- Encourage involvement and change for the whole family and all caregivers.

ABCs of Counseling and Motivating Overweight Children and Families

Ask Open-Ended Questions

- How do you feel about us talking about your physical activity, TV watching, and eating today?
- How concerned are you about your child’s weight? Why?
- What are some of the things you might like to change?

Body Language

- Put patient at ease.
- Use eye contact without barriers.
- Convey respect.
- Counsel in a private setting.

Care and Empathy

- Do not criticize.
- Acknowledge patient’s feelings.
- Answer questions without sign of judgment.
- Use language that is nonjudgmental
  - “Healthier” food vs “bad” food
  - “Healthier” weight vs “ideal” weight

Reproduced with kind permission of the Maine Center for Public Health and the American Academy of Pediatrics.
Section 3 Healthcare Provider Educational Tools
Healthcare Provider Tip Sheets

FAQs With Information Including BMI, Growth Charts, Nutrition (5–2–1–0 Messaging), Clinician Resources, and Community Involvement

1. What is BMI?
Body Mass Index (BMI) is a number calculated from a child’s height and weight. BMI is an inexpensive and easy-to-perform method of screening for weight categories that may lead to health problems. For children and teens, BMI is age- and sex-specific and is often referred to as BMI-for-age. (Source: www.cdc.gov)

2. What is a BMI percentile?
After BMI is calculated for children and teens, the BMI number is plotted on the CDC BMI-for-age growth charts (for either girls or boys) to obtain a percentile ranking.

<table>
<thead>
<tr>
<th>Weight Status Category</th>
<th>Percentile Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Underweight</td>
<td>Less than the 5th percentile</td>
</tr>
<tr>
<td>Healthy Weight</td>
<td>5th percentile to less than the 85th percentile</td>
</tr>
<tr>
<td>Overweight</td>
<td>85th to less than the 95th percentile</td>
</tr>
<tr>
<td>Obese</td>
<td>Equal to or greater than the 95th percentile</td>
</tr>
</tbody>
</table>

3. How is BMI used with children and teens?
BMI is used as a screening tool to identify possible weight problems for children. CDC and the American Academy of Pediatrics (AAP) recommend the use of BMI to screen for possible weight problems in children beginning at 2 years of age. BMI is not a diagnostic tool. For example, a child may have a high BMI for age and sex, but to determine if excess fat is a problem, a healthcare provider would need to perform further assessments. These assessments might include evaluations of diet, physical activity, family history, skin fold thickness, and other appropriate health screenings.

4. What about the growth chart?
This is where the beauty of pediatrics shines through. We love our growth charts. The tracking of BMI over time on a CDC BMI-for-age growth chart provides clinical information for assessment, education and intervention.

5. How do I calculate BMI?
Use a BMI wheel, calculator (see below for a link to the CDC) or the BMI formula:

BMI (English) = weight(lb) ÷ [height(in) x height(in)] x 703
BMI (Metric) = weight(kg) ÷ [height(m) x height(m)]

6. How do you take a proper height and weight measurement of a patient 2 years or older?

Measuring Weight
Children should be weighed using a platform scale. This may be a beam balance scale or a digital (electronic load cell or strain gauge) scale. Check your equipment regularly to make sure you are getting accurate measurements. Scales should be calibrated on a routine basis. Calibration involves putting known weight on the scale to check accuracy. Be sure the scale is placed on a flat, uncarpeted floor.

Procedure:
A. Ask the child to remove shoes and bulky clothing.
B. Place the scale in the “zero” position before the child steps on the scale.
C. Ask the child to stand still with both feet in the center of the platform.
D. Record the measurement to the nearest decimal fraction.
E. Have the child step off the scale.
FAQs With Information Including BMI, Growth Charts, Nutrition (5–2–1–0 Messaging), Clinician Resources, and Community Involvement (continued)

Measuring Height

A standing height board or stadiometer is required. This device has a vertical ruler with a sliding horizontal rod that adjusts to rest on the head. It also has a permanent surface to stand on or the entire device is mounted on the wall of a room with a level floor.

Procedure:

A. Before you begin, ask the child to remove shoes, hats, and bulky clothing, such as coats and sweaters. Ask the child to remove or undo hair styles and hair accessories that interfere with taking a measurement. In rare cases, a child may be unwilling to undo an intricate or costly hairstyle. In these situations, care should be taken to locate the actual crown of the head.

B. Direct the child to stand erect with shoulders level, hands at sides, thighs together, and weight evenly distributed on both feet. The child’s feet should be flat on the floor or foot piece, with heels comfortably together and touching the base of the vertical board. There are four contact points between the body and the stadiometer: head, upper back, buttocks, and heels.

C. Ask the child to adjust the angle of his/her head by moving the chin up or down in order to align head into the Frankfort Plane. The Frankfort Plane is an imaginary line from the lower margin of the eye socket to the notch above the tragus of the ear (the fleshy cartilage partly extending over the opening of the ear). This is best viewed and aligned when the viewer is directly to the side of and at the eye level of the child. When aligned correctly, the Frankfort Plane is parallel to the horizontal headpiece and perpendicular to the vertical back piece of the stadiometer. NOTE: When the chin is correctly positioned, the back of the head may not make contact with the board. In fact, in a very few individuals, only two points will make contact with the vertical back piece.

D. Ask the child to breathe in and maintain his/her position. Lower the headpiece until it firmly touches the crown of the head and is at a right angle with the measurement surface. Check contact points to ensure that the lower body stays in the proper position and the heels remain flat. Some children may stand up on their toes, but verbal reminders are usually sufficient to get them in proper position.

E. Record height to the nearest 1/8th of an inch. Adapted from the Center for Weight and Health at the University of California Berkeley.

7. What does 5–2–1–0 stand for?

5—Eat at least five fruits and vegetables a day.

2—Limit TV and computer use (not related to school) to two hours or less a day.

1—Get one hour or more of physical activity every day.

0—Drink less sugar. Try water and low-fat milk instead of soda and drinks with lots of sugar.

8. What is the science behind the 5–2–1–0 message?

There is a scientific rationale supporting each component of the 5–2–1–0 message. It has been used in doctors’ offices in Maine for the past three years and has been used in school settings for the past one and a half years. The 5–2–1–0 message is an easy way to begin an open discussion about the ways to increase physical activity and healthy eating.

5—Eat at least five fruits and vegetables on most days

Scientific Rationale: A diet rich in fruits and vegetables provides vitamins and minerals, important for supporting growth and development, and for optimal immune function in children. High daily intake of fruits and vegetables among adults is associated with lower rates of chronic diseases such as heart disease, stroke, high blood pressure, diabetes, and possibly, some types of cancers. Emerging science suggests fruit and vegetable consumption may help prevent weight gain, and when total calories are controlled, may be an important aid to achieving and sustaining weight loss.
FAQs With Information Including BMI, Growth Charts, Nutrition (5–2–1–0 Messaging), Clinician Resources, and Community Involvement (continued)

2—Cut recreational screen time to two hours or less daily
Scientific Rationale: According to the AAP, the average child watches an average of 5–6 hours of television a day. Watching too much television is associated with an increased prevalence of overweight and obesity, lower reading scores, and attention problems. The AAP therefore recommends that children under age 2 shouldn’t watch any television. In addition, the AAP recommends no TV or computer in the room in which the child sleeps, and no more than 2 hours of screen time a day.

1—Participate in one hour or more of physical activity every day
Scientific Rationale: Regular physical activity is essential for weight maintenance and prevention of chronic diseases such as heart disease, diabetes, colon cancer and osteoporosis. While most school-age children are quite active, physical activity sharply declines during adolescence. Children who are raised in families with active lifestyles are more likely to stay active as adults than children raised in families with sedentary lifestyles.

0—Drink water and low-fat milk instead of soda and sugar-sweetened drinks.
Scientific Rationale: Sugar-sweetened beverage consumption has increased dramatically over the past 20 years; high intake among children is associated with overweight/obesity, displacement of milk consumption, and dental cavities. It is recommended that children 1–6 years old consume no more than 4–6 ounces of juice per day and youth 7–18 years old consume no more than 8–12 ounces. Whole milk is the single largest source of saturated fat in children’s diets. Switching to low-fat or nonfat milk products significantly reduces dietary saturated and total fat, as well as total calories.

9. How do I use the 5–2–1–0 Survey in my practice?
The first thing to institute in your practice is the 5–2–1–0 Survey at all well-child checks for children 2 years and older. Questions to consider:

- When and where will the survey be handed out?
- Who will the patient/parent give the survey back to?
- Who will review the survey with the patient/family?
- Where will the survey be placed in the chart?

10. Are there discussion points for the survey I can use?
Discussion Points (Please note the questions below are from the survey for ages 10–18. The same discussion points apply to both age ranges.):

A. How many servings of fruits or vegetables do you eat a day?
5 or more servings of fruits or vegetables per day help provide a healthy diet. The palm of the child’s hand is a good reference for a serving size for meat and protein and most vegetables.

A more accurate guide for each meal is:

- 3 ounces of protein, such as chicken, lean meat, fish, tofu, or 2 tablespoons of peanut butter
- 1/2 cup to 1 cup of a starch, such as pasta, potato, rice, or 2 slices of bread
- 1/2 cup to 1 cup of vegetables
- 1/2 cup or one small piece fresh fruit
- 1 cup milk or 1–2 ounces of low-fat cheese

For more information, reference the following patient tools: “5 Brochure” and “Healthy Favorites: A booklet full of healthy tips and recipes”

B. How many times a week do you eat dinner at the table together with your family?
Family meals are associated with an increased intake of fruits, vegetables, and milk. Encourage families to eat meals together more. Mealtime is a great opportunity for parents to connect with their kids.

For more information, reference the following patient tool: “A Meal is a Family Affair”

C. How many times a week do you eat breakfast?
A daily breakfast is very important for a healthy diet. Skipping breakfast may be a risk factor for obesity.

For more information, reference the following patient tool: “Breakfast is Best!”

Section 3 Healthcare Provider Educational Tools

Healthcare Provider Tip Sheets

FAQs With Information Including BMI, Growth Charts, Nutrition (5–2–1–0 Messaging), Clinician Resources, and Community Involvement (continued)

D. How many times a week do you eat takeout or fast food?
Eating takeout or fast food may be associated with obesity. These foods have a tendency to be more fatty so children should eat them less often. If children do eat takeout or fast food, they should look for healthy options.

For more information, reference the following patient tool: “Healthy Favorites: A booklet full of healthy tips and recipes”

E. How many hours a day do you watch TV/movies or sit and play video/computer games?

F. Do you have a TV in the room where you sleep?

G. Do you have a computer in the room where you sleep?
The American Academy of Pediatrics recommends the following: 2 hours or less of recreational screen time. They also recommend: no screens in the child’s bedroom and no TV or computer under the age of 2.

For more information, reference the following patient tool: “2 Brochure”

H. How much time a day do you spend in active play (faster breathing/heart rate or sweating)?
One hour or more; the time spent doing physical activity can be separated out throughout the day.

For more information, reference the following patient tool: “1 Brochure”

I. How many 8-ounce servings of the following do you drink a day?

100% juice:
• 4–6 ounces for children 1–6 years old
• 8–12 ounces for children 7–18 years old
• Children 6 months and under should not be given juice

Water: unlimited

Fruit or sports drinks: limited—you can use this opportunity to have a conversation about when a sports drink is needed (after 60 mins of continuous vigorous activity).

Soda or punch: limited

Whole milk: recommended for children 1 year to 2 years. After age 2, children should be drinking low-fat or skim milk. Children under 1 year should drink breast milk or formula.

For more information, reference the following patient tool: “Calcium Counts!”

Fat-free or reduced fat milk:

- Children ages 2–3: 2 cups a day
- Children ages 4–8: 3 cups a day
- Pre-teens and teens: 4 cups a day

For more information, reference the following patient tool: “0 Brochure”

11. Will discussion of the 5–2–1–0 message lead to an increase in eating disorders such as anorexia nervosa?
There is no current evidence that bringing up healthy behaviors in a positive manner leads to disordered eating. The 5–2–1–0 message provides an easy way to discuss general health subjects that apply to everyone. Its purpose is to spread healthy behaviors. A recent study in a medical journal (Austin, et al., Archives of Pediatrics and Adolescent Medicine, vol. 159: 225–230) supported the idea that interventions like Let’s Go! may actually help prevent eating disorders in early adolescent girls.

12. How important is our office behavior to the success of this program’s implementation?
Role modeling is a very important part of changing behaviors among children. Healthy behaviors you can model include: offering healthy snacks at office meetings, holding walking meetings when possible, promoting the use of pedometers by staff, and not using food as a reward.

For more information, reference the following patient tools: “Healthy Favorites: A booklet full of healthy tips and recipes” and “Creating a Healthy Office Environment”
13. I have obese kids in my practice. Now what?

Good question! There are many resources being put in place to help providers. We have educational opportunities such as regional workshops that will be offered in your area. Additionally, the Let’s Go! Eat Right. Be Active. Get Healthy. Childhood Obesity Resource Toolkit for Healthcare Professionals is available by emailing infoletsgo@mmc.org. Finally, below are resources that you may find helpful to get you started.

Internet resources:

**Childhood Obesity Action Network (COAN):**
The Childhood Obesity Action Network is a web-based national network aimed at rapidly sharing knowledge, successful practices and innovation.

14. How do I get involved in my community?

Because providers are one component of a diverse plan to help children make healthy behavior changes, getting involved with your community can be very effective. Providers have the opportunity to leverage their public standing and their medical expertise to make changes in the overall health of the community. We want to help you get involved! Please contact Let’s Go! at infoletsgo@mmc.org with interest or ideas.
Key Elements to Include in an Encounter Form

1. **Vital Signs:**
   - Height and Weight
   - BMI
   - BMI percentile
   - Weight classification
     - <5% Underweight
     - 5–84% Healthy Weight
     - 85–94% At Risk for Overweight
     - ≥95% Overweight

2. **Current Health Habits:**
   - Nutrition
     - Fruits and vegetables
     - Sugar Sweetened Beverages
     - Milk—type and quantity
     - Snacking—types and quantity
   - Physical Activity
     - Type and quantity
   - Screen time
     - Type and quantity
     - TV/computer in the room the child sleeps

3. **Review of Systems:**
   - Constitutional
     - Sleep Habits
     - Fatigue/Lethargy
   - Respiratory
     - Snoring
     - Wheezing/Coughing
     - Difficulty breathing
   - Cardiovascular
     - Chest Pain
   - Gastrointestinal
     - Abdominal Pain/Vomiting/Constipation
     - Skin
     - Striae
   - Neurologic
     - Developmental Delay
     - Headache
   - Genitourinary
     - Menarche
     - Oligo/Amenorrhea
   - Musculoskeletal
     - Knee/Hip Pain
     - Limp

4. **Family History:**
   - Obesity
   - Diabetes
   - Hypertension
   - Cardiovascular Disease
   - Depression

5. **Social History:**
   - School/Daycare
   - Who lives at home?
   - Who helps parent?

6. **Past Medical History:**
   - Birth weight—IUGR/LGA
   - Mental Health

7. **Medications**

8. **Physical Exam:**
   - Special attention to respiratory, muscular skeletal, skin exam

9. **Assessment:**
   - Weight Classification
   - Lab work up
   - Readiness to Change

10. **Plan:**
    - Based upon Readiness to Change Tailor the Intervention
    - Goal Setting Worksheet if indicated
    - Follow up Plans
    - Referral to Specialist

Patient Evaluation Form (continued)

Labs

Recommended for patients with BMI 5th–<85th percentile with Risk Factors (HTN, tobacco use, DM, FHx: elevated lipid levels or premature CV disease):
- Fasting serum lipid panel

Recommended for patients with BMI 85th–<95th percentile with NO Risk Factors:
- Fasting serum lipid panel

Recommended for patients with BMI 85th–<95th percentile with Risk Factors (FHx: obesity-related diseases, HTN, elevated lipid levels, tobacco use):
- Fasting serum lipid panel
- Fasting glucose (if 100–126mg/dL, prediabetic; if >126 mg/dL, diabetic)
- AST/ALT

Optional:
1) Fasting serum insulin (nl<17)
2) 2–hour glucose tolerance test
3) If BMI >95th percentile and evidence of hypertension screen for focal segmental glomerulosclerosis:
   a) Urinary microalbumin level (1st morning void) (abnormal urinary albumin excretion rate >20 μg/minute)
   b) Spot urine microalbumin/creatinine ratio1,2,3 (abnormal >30 micrograms of albumin/milligrams Cr)
   c) Spot urine protein/creatinine ratio (abnormal >0.2)

Assessment

☐ Overweight (BMI 85th-94th Percentile)  ☐ Obese (BMI 95th percentile)

Associated comorbidities: __________________________________________________________

Dietary Modification:
- Nutrition Guidelines handout provided

Lifestyle Modification:
- Lifestyle Guidelines handout provided
- Exercise plan initiated
- Encouraged decreased sedentary time

Behavior Modification:
- Behavior Guidelines handout provided

Referrals:  ☐ Cardiology  ☐ Dietitian  ☐ Endocrinology
- ☐ ENT  ☐ Gastroenterology  ☐ Nephrology
- ☐ Ortho  ☐ Pulmonary  ☐ Weight management program

Follow up: __________________________________________________________

Remember: Weight loss is important in the treatment of all obesity-associated comorbidities.

Assessing Readiness for Change

Determining a patient’s readiness for change is essential for success. Discussing changes when a patient is not ready often leads to resistance, denial of problems and frustration that may hamper future efforts. The following tool provides a basis for starting discussions with patients. Using questionnaires may also provide valuable insight while saving valuable office visit time.

Effective Communication With Families

Scott Gee, MD; Jodi Ravel, MPH; Sandra Roberts, RN; Amanda Wylie, Regional Health Education—Kaiser Permanente Northern California

Communication Techniques

Lifestyle Advice—Well-Child or Urgent Visit
• <1 minute
• Children not currently at risk for overweight

Brief Focused Advice—Well-Child Visit
• <3 minutes
• Children who are overweight or at risk for overweight

Brief Negotiation & Cognitive Behavioral Skills—Follow up Visit or Weight Management Intervention
• 10+ minutes: single or multiple sessions
• Children who are overweight or at risk for overweight

Who Do You Communicate With?

2–5 Years Old
• Communicate with Parent
• Child in Room

6–12 Years Old
• Communicate with parent or both
• The first encounter, consider taking parent to your office to discuss in private first

Over 12 Years Old
• Communicate with teen or both
• The first encounter, consider having parent leave exam room first

Brief Negotiation Skills—Particularly Effective for Contemplative/Ambivalent Patients
• Asking open ended questions
• Listening
• Summarizing
• Clinician Style: empathetic, accepting, collaborative

Cognitive Behavior Skills—For Patients Ready and Willing to Make Changes
• Develop awareness of eating habits, activity and parenting behavior
• Identification of problem behaviors
• Problem solving and modification of problem behaviors
• Weekly goal setting for children and parents on dietary, activity and self-esteem/parenting goals
• Positive reward systems
• Record keeping
• Weight checks
Effective Communication With Families (continued)

Lifestyle Advice

To stay healthy and energized:
• Get up and play hard, 30–60 minutes a day
• Limit TV and video games to 60 minutes or less a day
• Eat 5 helpings of fruits or vegetables every day
• Limit sodas & juice drinks to 1 cup or less a day

Brief Focused Advice

Step # 1: Engage the Patient/Parent
• Can we take a few minutes together to discuss your health and weight?
• How do you feel about your health and weight?

Step # 2: Share Information (optional)
• Your current weight puts you at risk for developing heart disease and diabetes.
• What do you make of this?
• Some ideas for staying healthy include…(see poster)
• What are your ideas for working toward a healthy weight?

Step # 3: Make a Key Advice Statement
I strongly encourage you to...
• Get up and play hard, 30–60 minutes a day
• Limit TV and video games to 60 minutes or less a day
• Eat 5 helpings of fruits or vegetables every day
• Limit sodas and juice drinks to 1 cup or less a day
• Use patient ideas from step #2

Step # 4: Arrange for Follow up
• Would you be interested in more information on ways to reach a healthier weight? AND/OR
• Let’s set up an appointment in __ weeks to discuss this further.

Brief Negotiation

Open the Encounter

Ask Permission
- “Would you be willing to spend a few minutes discussing your weight?”
  - “Are you interested in discussing ways to stay healthy and energized?”

Ask an Open-Ended Question—Listen—Summarize
- “What do you think/How do you feel about your weight?”
  - “What have you tried so far to work toward a healthier weight?”

Share BMI/Weight/Risk Factors (Optional)
- Your current weight puts you at risk for developing heart disease and diabetes.
  - Ask for the patient’s interpretation: “What do you make of this?”
  - Add your own interpretation or advice as needed after eliciting the patient’s/parent’s response

Negotiate the Agenda
- “There are a number of ways to achieve a healthy weight. They include (see poster)”:  
  - Get up and Play Hard
  - Eat 5 helpings of fruits and vegetables a day
  - Cut back on TV and video games
  - Cut down on soda and juice
  - “Would you like to discuss any of these further today—or perhaps you have another idea that isn’t listed here?”

Assess Readiness
- “On a scale from 0 to 10, how ready are you to consider (option chosen above)”
  - Straight question: “Why a 5?”
  - Backward question: “Why a 5 and not a 3?”
  - Forward question: “What would it take to move you from a 5 to a 7?”

Explore Ambivalence
- Step 1: Ask a pair of questions to help the patient explore the pros and cons of the issue:
  - What are the things you like about______? And What are the things you don’t like about______?
  - What are the advantages of keeping things the same? And What are the advantages of making a change?
- Step 2: Summarize Ambivalence:
  - “Let me see if I understand what you’ve told me so far…”
  - Begin with reasons for maintaining the status quo, end with reasons for making a change
  - Ask: “Did I get it all/?Did I get it right?”

Tailor the Intervention

<table>
<thead>
<tr>
<th>Stage of Readiness</th>
<th>Key Questions</th>
</tr>
</thead>
</table>
| Not Ready: 0–3     | Would you be interested in knowing more about reaching a healthy weight?  
     • Raise Awareness  
     • Elicit Change Talk  
     • Advise and Encourage |
| Unsure: 4–6        | Where does that leave you now?  
     • Evaluate Ambivalence  
     • Elicit Change Talk  
     • Build Readiness |
| Ready: 7–10        | Why is this important to you now?  
     • Strengthen Commitment  
     • Elicit Change Talk  
     • Facilitate Action Planning |

Close the Encounter

- Summarize: “Our time is almost up. Let’s take a look at what you’ve worked through today…”
- Show Appreciation/Acknowledge willingness to discuss change: “Thank you for being willing to discuss your weight.”
- Offer advice; emphasize choice, and express confidence: “I strongly encourage you to be more physically active. The choice to increase your activity, of course, is entirely yours. I am confident that if you decide to be more active you can be successful.”
- Confirm next steps and arrange for follow up: “Are you able to come back in one month so we can continue to work together?”

Sample Dialogue of a Brief Negotiations Encounter

Before entering the exam room you note the patient's age, gender, BMI and percentile, blood pressure, and pulse which have been taken by your medical assistant.

**MD:** Good morning! I see you are in for your annual well-check. Do you have any concerns about your health?
Charles: No, my mom made me come in.

**MD:** Can we take a few minutes together to talk about your health and weight?
Charles: I guess so.

**MD:** How do you feel about your weight?
Charles: I know I’m bigger than most kids.

**MD:** Have you tried to do anything to get to a healthier weight?
Charles: Not really—I just eat what all my friends eat.

**MD:** Your family has a history of diabetes. Did you know that your current weight makes you more likely to develop diseases like diabetes?
Charles: No. My grandpa always complains about his diabetes.

**MD:** Yes, diabetes is not easy to live with—I can understand why he complains. OK, well let’s see what we can do to help you be healthy. Here are some ideas that my patients usually find helpful: eating at least 5 fruits and vegetables per day, cutting back on the number of sodas they drink, being physically active for 30 minutes or more, and reducing the amount of time they spend watching TV or playing on the computer. Do you want to talk about any of these, or do you have any other ideas?
Charles: Would riding my bike to school count as physical activity?
MD: It sure would! On a scale from 1 to 10, how ready do you think you are to start riding your bike to school?
Charles: Probably a 5.

MD: Why a 5?
Charles: Well, I don’t have anyone to ride with and there are a couple of busy streets.

MD: I see how that would make it sort of scary. What sounds good about riding your bike to school?
Charles: Riding my bike is pretty fun. And I wouldn’t have to wait in traffic in the car and be late for school.

MD: So the busy streets and having no one to ride with may make this change difficult, but you like to ride your bike and traffic wouldn't make you late for school if you were on your bike. Did I get it right?
Charles: Yeah.

MD: What do you think your next step is?
Charles: I guess I’ll try riding my bike to school one day next week. Maybe I’ll find someone to ride with along the way.

MD: Great. I think you are making a very healthy choice for yourself. Thank you for being so willing to discuss this with me. When you come back next month for your flu shot I want to hear how things are going.

Healthy Lifestyle Prescription

Patient’s Name ___________________________ Date __________________

Diagnosis ____________________________________________________________

Specific Instructions:
- Eat breakfast EVERYDAY.
- Eat at least 5 servings/day of fruits and vegetables.
- Eat healthy snacks like fruits, vegetables, and whole-grain crackers.
- Limit fast food and fried food.
- No supersizing fast food or drinks.
- Limit sugary drinks such as sodas and sports drinks.
- Limit juice to _________ ounces per day.
- Drink water when thirsty.
- Increase consumption of low-fat milk and dairy products (1% or skim milk).
- Play outside for 1 hour during the day.
- Limit TV/video/computer to 2 hours/day.

In my professional opinion, in accordance with accepted medical practice standards, the above-mentioned patient requires healthy lifestyle changes for the problems indicated above.

Receta Médica Para Un Estilo de Vida Saludable

Nombre de paciente __________________________ Fecha ________________

Diagnosis __________________________________________________________________________

Instrucciones:

☐ Desayune TODOS los días.
☐ Sirva al menos 5 raciones de frutas y vegetales al día.
☐ Come bocadillos saludables como frutas, vegetales, y galletas de trigo integral.
☐ Límite el consumo de comida rápida y comida frita.
☐ NO pida el tamaño extra grande.
☐ Límite el consumo de bebidas endulzadas como sodas y bebidas deportivas.
☐ Límite jugo a __________ onzas al día.
☐ Tome agua cuando tenga sed.
☐ Aumente el consumo de leche y productos lácteos bajos en grasa (1% de grasa o descremada).
☐ Juegue afuera por lo menos un hora al día.
☐ Límite el tiempo del uso de la televisión, videos, videojuegos, y computadora a no más de 2 horas al día.

En mi opinión profesional, de acuerdo con la práctica de medicina, el paciente mencionado necesita cambios en su estilo de vida para las problemas indicadas.

Firma de médico __________________________ Fecha ________________
Things to Think About Before a Practice Starts Measuring BMI

1. **The focus is on healthy behaviors.** It’s important to remember the focus should be on healthy behaviors and NOT on the weight. Healthy behaviors include 5-2-1-0, plus setting structured mealtimes, eating less fast food, and getting enough sleep.

2. **The 5-2-1-0 Survey.** The first thing to institute in your practice is the 5-2-1-0 Survey at all well-child checks for children 2 years and older. Questions to consider:
   - When and where will the survey be handed out?
   - Who will the patient/parent give the survey back to?
   - Where will the survey be placed in the chart?

3. **Goal setting with patients and families.** It’s important to have patients and families work on one area at a time. Simple, easily attainable goals are the key to success. An example is reducing intake of sugar-sweetened beverages.

4. **Parent information.** It’s important to have information for parents on how they can make simple changes in their lives to be healthier. The Let’s Go! Toolkit has many handouts available for your patients. These handouts will also be available on the Let’s Go! website in the coming months at www.letsgo.org. Questions to consider:
   - What handouts are you going to use?
   - Where will the handouts be stored/displayed?
   - Who is responsible for ordering/stocking handouts?

5. **Measuring BMI can be complicated.** Here are some things to consider:
   - How does your office currently measure patients’ height and weight? Who does the measuring? Is it standardized throughout the office?
   - Can the person who does the measuring also calculate the BMI and determine the BMI percentile and weight classification? (Usually one person does all of this.)
   - Where will the BMI percentile and weight classification be documented?
   - Are the appropriate staff trained in BMI calculations and documentation?
6. The language we use is very important when working with patients and families on healthy behaviors. Focus on positive, healthy behaviors, not on the weight.

- **A BMI of 5–84%** is medically termed “healthy weight”. It is still important to talk about healthy behaviors with this group.

- **A BMI of 85–94%** is medically termed “overweight”.
  - Instead of using the term “overweight”, try reviewing the BMI growth chart with the child/parent. Use wording such as “Your child might be carrying a little extra weight. It might not mean he/she has extra fat.”
  - Quickly steer the conversation to the 5-2-1-0 behaviors.
  - Ask the child/parent if there is one behavior they would like to work on.
  - Use the survey to help elicit interest.
  - If they are not interested in making a change now, stay positive and encourage them to pick a behavior to start thinking about.

- **BMI of 95–98%** is medically termed “obese”.
  - Instead of using the term “obese”, try “Your child has put on more weight than they have grown tall,” or “Your child is carrying around extra weight and this can put them at risk for health conditions such as heart disease and diabetes.”
  - Once again, quickly move the discussion to healthy behaviors.
  - Refer to the clinical algorithm in the Toolkit to determine the recommended evaluation, intervention and follow-up.

- **A BMI of 99% or greater** has no specific medical term.
  - Try using some of the wording reviewed above.
  - Additional discussion of the health risks such as heart disease, diabetes, and liver problems is warranted.
  - Once again, focus the visit on making healthy behavior choices.
  - Refer to the clinical algorithm.

7. It’s important to set a good example. Practices can set a good example by having healthy snacks available for office staff and avoiding junk food and soda.

8. Potential limitations on the use of the BMI. BMI does not directly measure fat, it measures weight. That said, there have been numerous studies determining BMI to be a good screening tool to identify children who have an increased percentage of body fat and are at risk for medical conditions, such as heart disease and diabetes.
Measuring Height and Weight

Measuring Weight
Children should be weighed using a platform scale. This may be a beam balance scale or a digital (electronic load cell or strain gauge) scale. Check your equipment regularly to make sure you are getting accurate measurements. Scales should be calibrated on a routine basis. Calibration involves putting known weight on the scale to check accuracy. Be sure the scale is placed on a flat, uncarpeted floor.

Procedure:
1. Ask the child to remove shoes and bulky clothing.
2. Place the scale in the “zero” position before the child steps on the scale.
3. Ask the child to stand still with both feet in the center of the platform.
4. Record the measurement to the nearest decimal fraction.
5. Have the child step off the scale.

Measuring Height
A standing height board or stadiometer is required. This device has a vertical ruler with a sliding horizontal rod that adjusts to rest on the head. It also has a permanent surface to stand on or the entire device is mounted on the wall of a room with a level floor.

Procedure:
1. Before you begin, ask the child to remove shoes, hats, and bulky clothing, such as coats and sweaters. Ask the child to remove or undo hair styles and hair accessories that interfere with taking a measurement. In rare cases, a child may be unwilling to undo an intricate or costly hairstyle. In these situations, care should be taken to locate the actual crown of the head.
2. Direct the child to stand erect with shoulders level, hands at sides, thighs together, and weight evenly distributed on both feet. The child's feet should be flat on the floor or foot piece, with heels comfortably together and touching the base of the vertical board. There are four contact points between the body and the stadiometer: head, upper back, buttocks, and heels.
3. Ask the child to adjust the angle of his/her head by moving the chin up or down in order to align head into the Frankfort Plane. The Frankfort Plane is an imaginary line from the lower margin of the eye socket to the notch above the tragus of the ear (the fleshy cartilage partly extending over the opening of the ear). This is best viewed and aligned when the viewer is directly to the side of and at the eye level of the child. When aligned correctly, the Frankfort Plane is parallel to the horizontal headpiece and perpendicular to the vertical back piece of the stadiometer. NOTE: When the chin is correctly positioned, the back of the head may not make contact with the board. In fact, in a very few individuals, only two points will make contact with the vertical back piece.
4. Ask the child to breathe in and maintain his/her position. Lower the headpiece until it firmly touches the crown of the head and is at a right angle with the measurement surface. Check contact points to ensure that the lower body stays in the proper position and the heels remain flat. Some children may stand up on their toes, but verbal reminders are usually sufficient to get them in proper position.
5. Record height to the nearest 1/8th of an inch.
Creating a Healthy Office Environment

The physician’s office is a worksite that can be a powerful tool to communicate healthy eating and active living messages.

- Hang physical activity and nutrition posters in waiting areas and in examination rooms; make them as prominent as vaccination posters.
- Create a 5-2-1-0 bulletin board:
  - Monthly or quarterly updates can feature patient activities in their communities.
  - Post resources and news articles for parents and children.
  - Post seasonal activities.
  - Feature a fruit or vegetable of the month.
- Play videos that show children taking part in nontraditional sports and other physical activities.
- Play videos of children trying new fruits and vegetables.
- Display books, puzzles and activity sheets that support healthy eating and active living to entertain children.
- Replace lollipop and candy rewards with stickers, bookmarks and other nonfood items.

Work with your staff to make healthy eating and active living a part of their lives.

- Have a staff contest to create an office slogan or universal message about healthy lifestyles.
- Sample a fruit or vegetable of the month—select items of different cultures to try.
- Host a healthy lunch.
- Provide 10-minute physical activity or walk break during the work day.

Obesity and Related Comorbidities Coding Fact Sheets for Primary Care Pediatricians

While coding for the care of children with obesity and related comorbidities is relatively straightforward, ensuring that appropriate payment is received for such services is a more complicated matter. Many insurance carriers will deny claims submitted with “obesity” codes (e.g., 278.00), essentially carving out obesity-related care from the scope of benefits. Therefore, coding for obesity services is fundamentally a two-tiered system, where the first tier requires that the provider submit claims using appropriate codes and the second tier involves the practice-level issues of denial management and contract negotiation.

This Coding Fact Sheet will provide you with a guide to coding for obesity-related healthcare services.

Procedure Codes

Body Fat Composition Testing
There is no separate CPT code for body fat composition testing. This service would be included in the examination component of the evaluation and management (E/M) code reported.

Calorimetry
94690 Oxygen uptake, expired gas analysis; rest, indirect (separate procedure)

or

94799 Unlisted pulmonary service or procedure
(Note: Special report required)

Glucose Monitoring
95250 Glucose monitoring for up to 72 hours by continuous recording and storage of glucose values from interstitial tissue fluid via a subcutaneous sensor (includes hook-up, calibration, patient initiation and training, recording, disconnection, downloading with printout of data)

Routine Venipuncture
36415 Collection of venous blood by venipuncture

36416 Collection of capillary blood specimen (e.g., finger, heel, ear stick)

Venipuncture Necessitating Physician’s Skill
36406 Venipuncture, under age 3 years, necessitating physician’s skill, not to be used for routine venipuncture; other vein

36410 Venipuncture, ages 3 years or older, necessitating physician's skill (separate procedure), for diagnostic or therapeutic purposes (not to be used for routine venipuncture)

Digestive System Surgery Codes

43644 Laparoscopy, surgical, gastric restrictive procedure; with gastric bypass and Roux-en-Y gastroenterostomy (roux limb 150 cm or less)

43645 Laparoscopy, surgical, gastric restrictive procedure; with gastric bypass and small intestine reconstruction to limit absorption

43770 Laparoscopy, surgical, gastric restrictive procedure; placement of adjustable gastric restrictive deviceband (e.g., gastric band and subcutaneous port components)

43771 Laparoscopy, surgical, gastric restrictive procedure; revision of adjustable gastric restrictive deviceband component only

43772 Laparoscopy, surgical, gastric restrictive procedure; removal of adjustable gastric restrictive deviceband component only

43773 Laparoscopy, surgical, gastric restrictive procedure; removal and replacement of adjustable gastric restrictive deviceband component only

43774 Laparoscopy, surgical, gastric restrictive procedure; removal of adjustable gastric restrictive deviceband and subcutaneous port components

43842 Gastric restrictive procedure, without gastric bypass, for morbid obesity; vertical-banded gastroplasty

43843 Gastric restrictive procedure, without gastric bypass, for morbid obesity; other than vertical-banded gastroplasty

43845 Gastric restrictive procedure with partial gastrectomy, pylorus-preserving duodenileostomy and ileileostomy (50 to 100 cm common channel) to limit absorption (biliopancreatic diversion with duodenal switch)

43846 Gastric restrictive procedure, with gastric bypass for morbid obesity; with short limb (150 cm or less) Roux-en-Y gastroenterostomy

Source: Reproduced with kind permission of the American Academy of Pediatrics.
43847 Gastric restrictive procedure, with gastric bypass for morbid obesity; with small intestine reconstruction to limit absorption

43848 Revision, open, of gastric restrictive procedure for morbid obesity; other than adjustable gastric restrictive deviceband (separate procedure)

Health and Behavior Assessment/Intervention Codes

These codes cannot be reported by a physician nor can they be reported on the same day as Preventive Medicine Counseling codes (99401-99412).

96150 Health and behavior assessment (e.g., health-focused clinical interview, behavioral observations, psychophysiological monitoring, health-oriented questionnaires), each 15 minutes face-to-face with the patient; initial assessment

96151 Health and behavior assessment (e.g., health-focused clinical interview, behavioral observations, psychophysiological monitoring, health-oriented questionnaires), each 15 minutes face-to-face with the patient; re-assessment

The focus of the assessment is not on mental health but on the biopsychosocial factors important to physical health problems and treatments.

96152 Health and behavior intervention, each 15 minutes, face-to-face; individual

96153 Health and behavior intervention, each 15 minutes, face-to-face; group (2 or more patients)

96154 Health and behavior intervention, each 15 minutes, face-to-face; family (with patient present)

96155 Health and behavior intervention, each 15 minutes, face-to-face; family (without patient present)

The focus of the intervention is to improve the patient’s health and well-being utilizing cognitive, behavioral, social, and/or psychophysiological procedures designed to ameliorate the specific obesity related problems.

Medical Nutrition Therapy Codes

These codes cannot be reported by a physician.

97802 Medical nutrition therapy; initial assessment and intervention, individual, face-to-face with patient, each 15 minutes

97803 Medical nutrition therapy; re-assessment and intervention, individual, face-to-face with the patient, each 15 minutes

97804 Medical nutrition therapy; group (2 or more individuals), each 30 minutes

Healthcare Common Procedural Coding System (HCPCS) Level II Procedure and Supply Codes

CPT codes are also known as Healthcare Common Procedure Coding System (HCPCS) Level I codes. The Healthcare Common Procedure Coding System also contains Level II codes. Level II codes (commonly referred to as HCPCS (“hick-picks”) codes) are national codes that are included as part of the Health Insurance Portability and Accountability Act of 1996 (HIPAA) standard procedural transaction coding set along with CPT codes.

HCPCS Level II codes were developed to fill gaps in the CPT nomenclature. While they are reported in the same way as CPT codes, they consist of one alphabetic character (A-V) followed by four digits. In the past, insurance carriers did not uniformly recognize HCPCS Level II codes. However, with the implementation of HIPAA, carrier software systems must now be able to recognize all HCPCS Level I (CPT) and Level II codes.

HCPCS Education and Counseling Codes

S9445 Patient education, not otherwise classified, non-physician provider, individual, per session

S9446 Patient education, not otherwise classified, non-physician provider, group, per session

S9449 Weight management classes, non-physician provider, per session

S9451 Exercise class, non-physician provider, per session

S9452 Nutrition class, non-physician provider, per session

S9454 Stress management class, non-physician provider, per session

S9455 Diabetic management program, group session

S9460 Diabetic management program, nurse session

S9465 Diabetic management program, dietitian visit

S9470 Nutritional counseling, dietitian visit

Obesity and Related Comorbidities Coding Fact Sheets for Primary Care Pediatricians (continued)

**Diagnosis Codes**

*International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) Codes*

**Circulatory System**

- 401.9 Essential hypertension; unspecified
- 429.3 Cardiomegaly

**Congenital Anomalies**

- 758.0 Down syndrome
- 759.81 Prader-Willi syndrome
- 759.83 Fragile X syndrome
- 759.89 Other specified anomalies (Laurence-Moon-Biedl syndrome)

**Digestive System**

- 530.81 Esophageal reflux
- 564.00 Constipation, unspecified
- 571.8 Other chronic nonalcoholic liver disease

**Endocrine, Nutritional, Metabolic**

- 244.8 Other specified acquired hypothyroidism
- 244.9 Unspecified hypothyroidism
- 250.00 Diabetes mellitus without mention of complication, type II or unspecified type, not stated as uncontrolled
- 250.02 Diabetes mellitus without mention of complication, type II or unspecified type, uncontrolled
- 253.8 Other disorders of the pituitary and other syndromes of diencephalohypophyseal origin
- 255.8 Other specified disorders of adrenal glands
- 256.4 Polycystic ovaries
- 259.1 Precocious sexual development and puberty, not elsewhere specified
- 259.9 Unspecified endocrine disorder
- 272.0 Pure hypercholesterolemia
- 272.1 Pure hyperglyceridemia
- 272.2 Mixed hyperlipidemia
- 272.4 Other and unspecified hyperlipidemia
- 272.9 Unspecified disorder of lipoid metabolism
- 277.7 Dysmetabolic syndrome X/metabolic syndrome
- 278.00 Obesity, unspecified
- 278.01 Morbid obesity
- 278.02 Overweight
- 278.1 Localized adiposity
- 278.8 Other hyperalimentation

**Genitourinary System**

- 611.1 Hypertrophy of the breast

**Mental Disorders**

- 300.00 Anxiety state, unspecified
- 300.02 Generalized anxiety disorder
- 300.4 Dysthymic disorder
- 307.50 Eating disorder, unspecified
- 307.51 Bulimia nervosa
- 307.59 Other and unspecified disorders of eating
- 308.3 Other acute reactions to stress
- 308.9 Unspecified acute reaction to stress
- 311 Depressive disorder, not elsewhere classified
- 313.1 Misery and unhappiness disorder
- 313.81 Oppositional defiant disorder

**Musculoskeletal System and Connective Tissue**

- 732.4 Juvenile osteochondrosis of lower extremity, excluding foot

**Nervous System and Sense Organs**

- 327.23 Obstructive sleep apnea (adult) (pediatric)
- 327.26 Sleep related hypoventilation/hypoxemia in conditions classifiable elsewhere
- 327.29 Other organic sleep apnea
- 348.2 Benign intracranial hypertension

**Skin and Subcutaneous Tissue**

- 701.2 Acquired acanthosis nigricans

**Symptoms, Signs, and Ill-Defined Conditions**

- 780.50 Sleep disturbance, unspecified
- 780.51 Insomnia with sleep apnea, unspecified

*Source: Reproduced with kind permission of the American Academy of Pediatrics.*
Obesity and Related Comorbidities Coding Fact Sheets for Primary Care Pediatricians (continued)

780.52 Insomnia, unspecified
780.53 Hypersomnia with sleep apnea, unspecified
780.54 Hypersomnia, unspecified
780.57 Unspecified sleep apnea
780.71 Chronic fatigue syndrome
780.79 Other malaise and fatigue
783.1 Abnormal weight gain
783.3 Feeding difficulties and mismanagement
783.40 Lack of normal physiological development, unspecified
783.43 Short stature
783.5 Polydipsia
783.6 Polyphagia
783.9 Other symptoms concerning nutrition, metabolism, and development
786.05 Shortness of breath
789.1 Hepatomegaly
790.22 Impaired glucose tolerance test (oral)
790.29 Other abnormal glucose; pre-diabetes not otherwise specified
790.4 Nonspecific elevation of levels of transaminase or lactic acid dehydrogenase [LDH]
790.6 Other abnormal blood chemistry (hyperglycemia)

V85.53 Body Mass Index, pediatric, 85th percentile to less than 95th percentile for age
V85.54 Body Mass Index, pediatric, greater than or equal to 95th percentile for age
V58.67 Long-term (current) use of insulin
V58.69 Long-term (current) use of other medications
V61.0 Family disruption
V61.20 Counseling for parent-child problem, unspecified
V61.29 Parent-child problems; other
V61.49 Health problems with family; other
V61.8 Health problems within family; other specified family circumstances
V61.9 Health problems within family; unspecified family circumstances
V62.81 Interpersonal problems, not elsewhere classified
V62.89 Other psychological or physical stress not elsewhere classified; other
V62.9 Unspecified psychosocial circumstance
V65.19 Other person consulting on behalf of another person
V65.3 Dietary surveillance and counseling
V65.41 Exercise counseling
V65.49 Other specified counseling
V69.0 Lack of physical exercise
V69.1 Inappropriate diet and eating habits
V69.8 Other problems relating to lifestyle; self-damaging behavior
V69.9 Problem related to lifestyle, unspecified
V85.51 Body Mass Index, pediatric, less than 5th percentile for age
V85.52 Body Mass Index, pediatric, 5th percentile to less than 85th percentile for age
V85.53 Body Mass Index, pediatric, 85th percentile to less than 95th percentile for age
V85.54 Body Mass Index, pediatric, greater than or equal to 95th percentile for age

Other
NOTE: The ICD-9-CM codes below are used to deal with occasions when circumstances other than a disease or injury are recorded as “diagnoses” or “problems.” Some carriers may request supporting documentation for the reporting of V codes.

V18.0 Family history of diabetes mellitus
V18.1 Family history of endocrine and metabolic diseases
V49.89 Other specified conditions influencing health status
V85.51 Body Mass Index, pediatric, less than 5th percentile for age
V85.52 Body Mass Index, pediatric, 5th percentile to less than 85th percentile for age

Patient/Family Educational Tools
A Meal Is a Family Affair

In such a busy world, mealtimes often revolve around our lifestyles. As a result of this, we miss meals or eat foods that are not the best for our bodies. Did you know that experts have found that kids who eat regularly with their families are more likely to eat fruits, vegetables, and whole grains? So, no matter how busy life may seem, it’s important to make family meals a priority.

To get started, try some of these ideas:

• Choose a time when everyone can enjoy at least one meal together—it may be breakfast, lunch, or dinner.

• As the parent, you should decide what time meals are served and what the choices are. Your children can then decide what to eat and how much.

• Include your children in preparing the meal and turn off the TV.

• Gather around the table for a meal.

• Make the meal pleasant by keeping the conversation positive.

• Help your child learn good manners and mealtime behaviors.

• Limit eating and drinking unhealthy snacks between meals.

• Role model the habits you want your children to develop.

Calcium Counts!

Calcium is a mineral found in some foods and drinks. It works with other vitamins and minerals to build strong bones and teeth for life! The best sources of calcium in the diet are milk and milk products. The United States Department of Agriculture says that most young people should drink nonfat or low-fat milk products in these amounts:

Children ages 1–3: 2 cups a day
Children ages 4–8: 3 cups a day
Preteens and teens: 4 cups a day

What if your child can’t or won’t drink that much milk?

Other foods containing smaller amounts of calcium include low-fat macaroni and cheese, turnip or beet greens, kale, canned salmon, broccoli, cottage cheese, navy or pinto beans, almonds, and oranges.

If milk products cause gas or diarrhea in an older child, don’t let that stop her from getting enough calcium. Serve Lactaid™ (specially treated) milk instead of regular milk. Small servings of yogurt and cheese may not cause a problem.

If your child has an allergy to milk, ask your healthcare provider how to select a calcium supplement. Or, ask for a nutrition “check up” to help you make sure your child is getting enough calcium.

Here are some easy options that have the same amount of calcium (300 mg) as a cup of nonfat milk:

• Yogurt, nonfat or low-fat, 1 cup; choose those with less added sugar or corn syrup

• Smoothies made with milk, yogurt, and frozen fruit

• Nonfat or low-fat chocolate milk, 1 cup; try mixing chocolate milk 50/50 with low-fat or skim white milk

• Cheese, 2 ounces

• Orange juice plus calcium, 1 cup

• Calcium-fortified soy milk, 1 cup (shake well)

• Total cereal, 3/4 cup

Breakfast Is Best

Boost your energy and brain power!

Why eat breakfast every day?

• It will give you the energy you need to start your day. It is “fuel” for the body!
• It can help you do better in school!
• It can help you feel and act your best!
• It can help with weight control and keep you healthy!

Not hungry in the morning? Start small… try:

• a cup of low-fat fruit blend yogurt
• a piece of fruit such as a banana, orange or apple
• a bowl of cereal with low-fat milk
• a slice of toast with peanut butter and a glass of low-fat milk
• half of a toasted English muffin with a slice of low-fat cheese
• trail mix of raisins, nuts and cereal

Keep it simple, but keep it delicious! You may like:

• oatmeal with cinnamon, applesauce, a glass of low-fat milk
• a waffle or pancake with light syrup and blueberries
• an English muffin with a slice of ham, egg and low-fat cheese
• a low-fat raisin bran muffin, glass of low-fat milk and a banana

How To Add Fiber To Your Meals

Fiber is the part of plant foods that the body can not digest. Eating more fiber can help your child prevent constipation, diabetes, and heart disease. Foods that contain a lot of fiber are filling, have lots of vitamins and minerals, and help children maintain a healthy weight.

Fiber should be added very gradually to give the body time to adjust. Drinking plenty of fluids helps fiber do its work.

How much fiber is enough?

You can find out how much fiber is in food by looking for the “dietary fiber” line on food labels. A simple rule of thumb: children ages 3-15 should aim for “age plus 5 grams” of fiber. For example, an 8-year-old should eat 8 plus 5=13 grams of fiber a day. Older teens should eat 20–35 grams of fiber a day.

Here are some easy ways to add fiber:

• Serve high-fiber cereal for breakfast, like bran flakes, oatmeal, or shredded wheat
• Add some raisins or a banana to breakfast cereal
• Serve whole fruit instead of juices
• Add a salad to lunch or dinner
• Eat apples, pears, and potatoes with the peels on
• Add beans (like kidney or navy beans) to salads and soups or eat baked beans as a side dish
• Popcorn makes a great high-fiber snack
• Fill 3/4 of the lunch or dinner plate with plant-based foods, such as fruits, vegetables, and whole grains

The Fittest Food

Nutritious foods give your family the most vitamins, minerals and other nutrients for the fewest calories.

Naturally nutritious foods make your child’s calories count:

- Brightly colored fruits and 100% fruit juices
- Vibrant-colored vegetables
- Lean meat, skinless poultry, fish, eggs, beans, and nuts
- Fat-free and low-fat milk, cheese, and yogurt
- Whole, fortified, and fiber-rich grain foods

Tips to Help Your Kids Eat Healthier:

Picky eaters? Remember, experts say that parents and caregivers, not children, should decide what foods to buy and serve. New foods may have to be offered many times before they are accepted. Here are some easy ways to get your child to accept unfamiliar nutritious foods:

- Combine whole grain/high-fiber cereals with your child’s favorite cereal.
- Make your own pizza with prepared whole wheat dough, a few veggies, and part-skim mozzarella cheese.
- Children ages 2 and older: slowly step down from whole milk to low-fat to fat-free milk.
- Clean and cut up fresh veggies in advance. Kids love dips, so serve them with salsa or hummus!
- On-the-go options: dried fruits, nuts, hard boiled eggs, low-fat cheese sticks, yogurt cups, and single-serve fruits canned in water or 100% fruit juice.

These nutritious foods are inexpensive and convenient:

- Canned beans (rinse well)
- Frozen vegetables
- Fresh fruit in season
- Whole grains in bulk
- Store brand whole-grain breakfast cereals

What’s a Healthy Portion?

Food portions are larger than ever these days—usually much more than you need. The recommended serving size is enough. But how much is that? These tips will help keep your portions, as well as your waistline, right-sized.

Here are some tips to help you keep your portions under control:

- Teach your children portion size by relating food to everyday items. For example, a deck of cards is equal to a serving of meat, fish, or poultry. An apple or serving of fruit is about the size of a tennis ball.

- Teach your children the concept of the divided plate. Think of a plate divided into four equal sections. Use one of the top sections for protein, and the other one for starch, preferably a whole grain; fill the bottom half with veggies (none of the foods should overlap or be piled high).

- Check the label on your food to see if it meets some basic needs in your diet, like calcium or Vitamin C; if it’s not “good” for you, eat less of that food.

- Avoid eating directly out of the package. Try putting snacks into a small bowl or snack-size baggie.

- Eat three meals a day; this way you won’t stuff yourself if you have skipped a meal.

- Serve food on smaller plates.

- Serve meals from the stove. This tip will keep you from feeling tempted to eat more when you are not hungry.

- Skip the “clean plate” club. Instead, encourage your children to start with smaller portions and eat until they are satisfied.

- At restaurants, ask for a lunch-size portion or share your meal.

- Role model the behaviors that you want your children to develop.

Get Your Portions in Proportion

Five simple, healthy steps families can take when serving food at home:

1. Breads, Cereals and Grains
   A bagel the size of a hockey puck = 2 servings.
   • Health experts recommend that adults eat at least six servings of breads, cereals and grains daily. At least half of those grain servings should be whole grain.* A bagel the size of a hockey puck equals two of those servings.

2. Meat, Poultry or Seafood
   A meat, poultry or seafood portion the size of a deck of cards = 1 serving.
   • Health experts recommend that adults eat two servings of lean meat, poultry or seafood daily. An average serving size is three ounces cooked. That’s the size of a deck of cards.

3. Fruits and Vegetables
   An apple or orange the size of a tennis ball = 1 cup.
   Carrots or broccoli the size of a fist = 1 cup.
   A potato the size of a computer mouse = 1 cup.
   • Health experts recommend that adults should have two cups of fruit daily and two and one half cups of vegetables daily.

4. Serve only from the Kitchen Counter!
   • When serving meals at home, portion your food at the counter. Then, instead of bringing all the extra food to the table, leave it on the counter. Studies show people are far less likely to load their plate a second time—and double their calories—if the food is not right in front of them.

5. Serve it on the Side!
   Teaspoon of butter = 36 calories
   • Serve salad dressing, sour cream, mayonnaise and butter on the side, or use salsa or mustard to add flavor without additional calories. Every added teaspoon of butter, margarine or oil is approximately 36 more calories.

*Whole grains are: brown rice, bulgur (cracked wheat), graham flour, whole grain corn, oatmeal, pearl barley, whole oats, whole rye, whole wheat. Examples of these foods are whole wheat bread; whole grain ready-to-eat cereal; low-fat whole wheat crackers; oatmeal; whole wheat pasta; whole barley added to soups, casseroles, and salads.
Get Your Portions in Proportion (continued)

What’s a Serving?
- A whole fruit the size of a tennis ball
- 1/2 cup of cut up fruit or vegetables
- 1 cup of raw leafy greens
- 1/4 cup of dried fruit
- 3/4 cup of 100% juice
  Limit to one serving per day

However, serving sizes for very young children are less.
- Ages 1–3 years a serving is 1/4 cup.
- Ages 4–6 years a serving is 1/3 cup.

Choose With the Seasons!

Summer—enjoy the harvest, whether from your own garden, vegetable stands or markets. Eat and preserve fruits and vegetables that are local, fresh, and at the peak of ripeness.

Fall—most tree fruit is plentiful and will store well in a cool shed or cellar. Winter squash, cauliflower, broccoli are in season and provide a great value.

Winter—root vegetables like carrots, turnip, onions, beets, and cabbage.

Spring—Think dark leafy greens and add nuts or dried fruits to spicce up a salad.

Make vegetables the largest portion on your plate.

# Drink Comparison Chart

**Tool Name:** Drink Comparison Chart and Display

**Use:** To demonstrate (and provide a visual display) how much sugar is contained in each drink.

**Directions:**
- For Simple Chart—Post on bulletin board or show patient/family.
- For Display—Purchase bottles in sizes below, empty, dry and fill with appropriate amounts of sugar. Substitutions may be used by calculating sugar content 4.2 gms/teaspoon or 200 gms/cup.
- For Exercise—Ask child to fill an empty bottle with the amount of sugar he/she thinks it contains.

Nutrition Tips

Get a Healthy Start on Eating Smart

One of the best ways you can help your family stay healthy is to focus on good nutrition and develop smart eating habits early. You may not realize it, but you are the best example your children have when it comes to developing their own eating habits. Use this opportunity, and the following tips, to show them the best way to get a healthy start on eating smart.

Guidelines for Eating Smart

Eat breakfast. Teach your children that breakfast is the most important meal of the day. By skipping breakfast, you're setting your child up to be tired and hungry throughout the day.

Drink water. By keeping your children's beverage intake mostly to water, you're teaching them a healthier way to quench their thirst. Fruit-flavored drinks and soda both contain extra, empty calories. Try to have your child drink at least four large glasses of water each day, and more if they're very active.

Can the soda. A 12-ounce can of regular soda has at least 10 teaspoons of sugar in it, and while diet soda may seem like a good alternative, it still contains artificial ingredients as well as caffeine.

Downsize, not supersize. How much you eat is just as important as what you eat. Keep in mind that serving sizes vary. Learn to keep an eye on how big the plate is and how much you eat, both at home and when dining out.

Snack attack. Most snack foods are high in calories and fat. Instead of snack cakes, candy bars, or chips, try offering your child these foods instead: dried fruit, low-fat yogurt, air-popped popcorn, fruit cocktail in light syrup or juice, unsalted roasted nuts, frozen grapes, bananas, or all-fruit pops.

Filling, fantastic fiber. Foods rich in dietary fiber are great for many reasons. First, they're filling. Second, they can help improve digestion and provide long-term energy. Foods rich in fiber include bran cereals, fresh and dried fruits, broccoli, asparagus, peas, corn, cabbage, brussels sprouts, whole grain breads, brown rice, lentils, and popcorn—air-popped with a small amount of salt.

Calcium for strong bones. To ensure that your child's bones grow strong, make sure that they're getting enough calcium. Aim for three to four servings each day. Foods rich in calcium include skim milk, low-fat yogurt or cheese, cottage cheese, certain green vegetables (like broccoli and spinach), calcium-fortified orange juice, calcium-fortified tofu, and salmon. A great after-school snack loaded with calcium is a smoothie made with low-fat vanilla yogurt, low-fat milk, and a frozen banana. (You can also try adding frozen strawberries, blueberries, or raspberries.)

Lean protein. Protein is a key nutrient. Lean protein foods should be the main source of protein in your diet. These foods include skinless chicken or turkey breast, fish, shellfish, ham, Canadian bacon, lean red meats, egg whites, low-fat milk, low-fat yogurt, low-fat cheeses, legumes (such as baked beans, kidney beans, chick peas, lima beans), tofu, and soybeans.

Nutrition Tips (continued)

Fast foods are fat foods. Today’s families are often busy, and the convenience of fast food is very appealing. However, most fast-food restaurants offer selections that are high in fat and calories. If you are eating out, make the healthiest choices you can. Bring home a pizza with vegetable toppings. Go for a small plain hamburger, a grilled chicken sandwich, or a green salad with low-fat dressing.

Variety is valuable. Offering your children a variety of foods from an early age will encourage them to try new things. Many parents assume that kids will only stick to one or two foods they enjoy, but the more you offer them different things, the more likely they are to try—and enjoy—healthy options.

Don’t diet. Low-carb, no carb, high-protein, low-protein. No matter what you may hear, diets are just short-term attempts to fix what requires a long-term solution. Don’t diet yourself, and never put your child on a diet. Eat modest portions of a variety of foods, including lots of fresh fruits and vegetables, and your child will learn that it’s moderation and variety that matter.

Reading Food Labels. The new food labels carry an up-to-date, easier-to-use nutrition information guide which is required on almost all packaged foods. The Nutrition Facts labels serve as a key to help in planning a healthy diet.

</table>

Calories per gram:

<table>
<thead>
<tr>
<th>Fat</th>
<th>Carbohydrate</th>
<th>Protein</th>
</tr>
</thead>
</table>

Serving sizes. All values on the label are based on the serving size. If you eat two servings, multiply all values by two. Use serving sizes to compare two different products.

List of nutrients covers those most important to the health of today’s consumers, most of whom need to worry about getting too much of certain nutrients (fat, for example), rather than too few vitamins or minerals, as in the past.

The label of larger packages may now tell the number of calories per gram of fat, carbohydrate, and protein.

New title signals that the label contains the newly required information.

Calories from fat are now shown on the label to help consumers meet dietary guidelines that recommend people get no more than 30 percent of the calories in their overall diet from fat.

% Daily Value shows how a food fits into the overall daily diet.

Daily Values. Some are maximums, as with fat (65 grams or less); others are minimums, as with carbohydrate (300 grams or more). The daily values for a 2,000- and 2,500-calorie diet must be listed on the label of larger packages.

Parent Tips: Making Healthier Food Choices

As a parent, you want to give your family the best you can. Serving healthier foods in the appropriate portions per food group and calorie level is one of the best ways to ensure that your children are getting proper nutrition without eating too many calories. These simple tips can help you plan and prepare meals and snacks to help your family to get the most nutrition out of the calories consumed.

What is a “Healthy Diet”?  
The U.S. Dietary Guidelines for Americans describes a healthy eating plan as one that:

- Emphasizes fruits, vegetables, whole grains, and fat-free or low-fat milk and milk products;
- Includes lean meats, poultry, fish, beans, eggs, and nuts;
- Is low in saturated fats, trans fats, cholesterol, salt (sodium), and added sugars; and
- Stays within your calorie needs.

We Can! has tips and tools to help you choose and prepare healthier foods for your family. Use these tips and tools to help your family eat nutritiously and help them maintain a healthy weight.

GO, SLOW, and WHOA Foods

Focus on Food Choices

GO foods are the lowest in fat and added sugar. They are also “nutrient dense” (which means they are better sources of vitamins, minerals, and other nutrients important to health) and relatively low in calories. Enjoy GO foods almost anytime. Examples of GO foods are: fruits (fresh, frozen, or canned in juice), vegetables (fresh, frozen without added fat, canned without added sodium), whole grains, fat-free or low-fat milk products, lean meat, poultry, fish, beans, egg whites or egg substitute.

SLOW foods are higher in fat, added sugar, and/or calories than GO foods. SLOW foods include: vegetables with added fat, white refined flour bread, low-fat mayonnaise, and 2% low-fat milk. Have SLOW foods sometimes or less often.

WHOA foods are the highest in fat and/or added sugar. They are “calorie dense” (a small portion is relatively high in calories), and many are low in vitamins, minerals, and other nutrients as well. Have WHOA foods only once in a while or on special occasions. And, when you do have them, have small portions. Examples of WHOA foods are: whole milk, cheese, fried potatoes, croissants, muffins, butter, and creamy salad dressings.

Source: We Can! is an effort of the the National Heart, Lung, and Blood Institute (NHLBI) in collaboration with the National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK), the National Institute of Child Health and Human Development (NICHD) and the National Cancer Institute (NCI).
Parent Tips: Making Healthier Food Choices (continued)

Healthy Eating Choices

From WHOA to SLOW to GO. How you choose to prepare or order your food when eating out can quickly turn a less healthy food into a healthier option. Choosing baked, broiled, steamed, grilled, and microwaved foods saves you from extra fat and calories. See the example on how similar foods can go from a WHOA to a SLOW or to a GO food.

<table>
<thead>
<tr>
<th></th>
<th>WHOA (eat once in a while)</th>
<th>Calories</th>
<th>SLOW (eat sometimes or less often)</th>
<th>Calories</th>
<th>GO (eat almost anytime)</th>
<th>Calories</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fruit</td>
<td>Apple pie, 1/8 of 9-inch pie</td>
<td>296</td>
<td>Baked apple, 1 cup slices, with 1 Tbsp butter</td>
<td>193</td>
<td>Apple, 1 medium</td>
<td>72</td>
</tr>
<tr>
<td>Bread</td>
<td>½ plain bagel (3 ½ inch) with 1 Tbsp butter and jelly</td>
<td>249</td>
<td>½ plain bagel (3 ½ inch) with 1 Tbsp jelly</td>
<td>147</td>
<td>1/2 whole wheat bagel (3 ½ inch)</td>
<td>91</td>
</tr>
<tr>
<td>Meat</td>
<td>Fried chicken, 2 drumsticks</td>
<td>386</td>
<td>Roasted chicken breast with skin, ½ breast</td>
<td>193</td>
<td>Roasted chicken breast without skin, ½ breast</td>
<td>142</td>
</tr>
</tbody>
</table>

You can go from WHOA to GO by making these substitutions when cooking. Substituting the low-fat and fat-free versions of foods as alternatives to the full fat items can help reduce overall calories of favorite foods without affecting taste. Try using low-fat mozzarella cheese in lasagna instead of the full fat variety. Your family will likely not notice the difference. Substitute applesauce for butter in baking and still get a rich, moist product. Try some of the calorie-reducing substitutions below when you cook or bake.

<table>
<thead>
<tr>
<th>Instead of:</th>
<th>Substitute:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 cup cream</td>
<td>1 cup evaporated fat-free milk</td>
</tr>
<tr>
<td>1 cup butter, stick margarine, or shortening for baking</td>
<td>Tub margarine, vegetable oil, or ½ cup apple butter or applesauce without added sugar</td>
</tr>
<tr>
<td>1 egg</td>
<td>2 egg whites or ¼ cup egg substitute</td>
</tr>
<tr>
<td>Butter or stick margarine for sautéing</td>
<td>Cooking spray, low-sodium chicken broth, or a small amount of olive oil or vegetable oil</td>
</tr>
</tbody>
</table>

For more tips on making healthier substitutions, visit http://www.nlm.nih.gov/medlineplus/foodandnutrition.html

Also, check out heart healthy recipes from the National Institutes of Health (NIH) at http://www.nlm.nih.gov/medlineplus/foodandnutrition.html
Parent Tips: Making Healthier Food Choices (continued)

Making healthier selections when dining out. There are several things you can do at restaurants to lower your intake of fat and calories. For example, order foods that are steamed, broiled, baked, roasted, poached, or lightly sautéed or stir-fried. You can also trim visible fat from poultry or meat. In addition, request:

- olive oil for dipping instead of butter or margarine
- fat-free or low-fat milk rather than whole milk or cream in coffee or in other drinks
- food without butter, gravy, or sauces
- salad dressing “on the side” and request light or fat-free dressing
- steamed vegetables or a fruit cup as a substitute for french fries
- “hold the cheese” or “cheese on the side” when ordering sandwiches or salads so you can decide how much cheese you want to eat.
- unsweetened beverages, such as water, unsweetened iced-tea, or sugar-free or diet iced-tea and lemonade.

Portion Distortion

Anyone who has eaten out lately is likely to notice how big the food portions are. It’s hard to find “small” anymore—“supersize” is more like it. Sometimes your plate arrives and there’s enough food for two or even three people. These ever-large portions have changed what we think of as a “normal” portion, and that affects how much food we eat at home as well. Cutting back on portion size can help you and your family limit your calorie intake. Follow these simple tips to get started:

- Select an appetizer that is low in fat and includes a fruit or vegetable instead of an entrée at a restaurant.
- Put a smaller portion on a smaller plate; it won’t look so skimpy.
- Share a portion with a family member or friend.
- Instead of giving your child or yourself an entire bottle of fruit juice or soda, pour a small amount (1/2 cup) into a cup. Better yet, choose water or small amounts of 100% fruit juice over soda.
- Use tall, narrow glasses instead of short, wide glasses. You will drink less.
- Order a medium pizza instead of a large. Everyone gets the same number of slices as before; they’re just smaller.
- Before you eat your meal ask the wait staff to put half of the meal in a take home bag for leftovers to eat the next day.

Compare the size of foods from 20 years ago to today. Portions have grown and so have the calories!

To test your knowledge on serving sizes, check out the Portion Distortion activity on the We Can! website, http://hp2010.nhlbihin.net/portion/index.htm.

We Can!, or “Ways to Enhance Children’s Activity & Nutrition,” is a national education program designed for families and communities to help children achieve a healthy weight. The program focuses on three important behaviors: improved food choices, increased physical activity and reduced screen time.

For more information about We Can! visit http://wecan.nhlbi.nih.gov or call 1-866-35-WECAN.
Parent Tips: Healthier Eating While Saving Money

Deciding which foods to serve your family each week can be hard, especially if you are on a tight budget. There are so many choices at the store that decisions are often based on what we see in front of us, rather than on a plan for making healthier choices. The We Can! program can help you plan your family meals before you go to the store.

Creating a healthier food plan depends on what foods are in season, what foods your family likes, and what foods you have at home already. You can also plan around sale items. Not only will you make more informed choices, but you may also be able to save money and time. Also, eating healthier foods in moderate portions and saving leftovers will help trim your budget and waistline by eating fewer calories at one time.

**Ahead**

- **Make a plan and stick to it.** With a little planning, you can get most of your groceries for the week in one trip, which will save a lot of time. And, the fewer trips to the store, the less likely you will be to buy unnecessary items. To help you plan, use the We Can! Weekly Meal Planner that can be found in the We Can! Resources on the website.

- **Review store ads and clip coupons for healthier items** such as skinless chicken breasts, lean cuts of meat or ground beef, fruit (fresh, frozen, or canned in its own juice), vegetables (fresh, frozen without added fat, or canned without added sodium), whole grain breads and cereals, and low-fat or fat-free milk and milk products.

- **Check your cupboards and refrigerator** for items that you can use and then plan to use them.

- **Check out heart healthy recipes** from the National Institutes of Health (NIH) to help you plan your meals and shopping list at http://www.nhlbi.nih.gov/health/index.htm#recipes

- **To help you prepare your grocery list,** you can download the We Can! Grocery List Template and My Shopping List to help organize your weekly grocery shopping. Both can be found in We Can! Resources on the website.

- **Don't shop hungry.** If you shop when you are hungry, you are more likely to buy more than you need and possibly buy less healthy items that appeal to you at that moment.

- **Try to go grocery shopping without children.** Stores put foods that many children like such as candy and sugary cereal where they can see and reach them. These foods are often advertised with characters that appeal to children. If you must bring children, grocery shopping can be a great way to teach them about food and nutrition (and colors, math, and reading!)

**Grocery Shopping Tips**

- **Sign up for your grocer's bonus/discount card** for additional savings.

- **Try store brands.** The most costly brands are typically placed at eye level. Store brands that may be cheaper and are just as good are often placed higher or lower on the shelf.

- **Comparison shop for healthier brands.** Read the Nutrition Facts Label. Learn how to find serving sizes and the per serving amounts of calories, fat, saturated fat, trans fat, sodium, sugars, protein, fiber, and vitamins and minerals. For more information on the Nutrition Facts Label, check out the Live It section of the We Can! website.

- **Use the unit price and the Nutrition Facts Label to compare similar foods.** The unit price tells you the cost per ounce, pound, or pint, so you’ll know which brand and size are best to buy. Look for it on the shelf sticker below the product. Then, read the Nutrition Facts Label to be sure that you are getting the healthiest option at the lowest cost. Click on these Food Label resources from the Food and Drug Administration (FDA): http://www.csfan.fda.gov/~ear/hwm/labelman.html and http://www.csfan.fda.gov/~acrobat/nutractds.pdf.

- **No matter what the form—fresh, frozen, canned, dried, juice—all varieties of fruits and vegetables count toward your daily recommendation.** Choose fruits without added sugar or syrups and vegetables without added salt, butter, or cream sauces. Although 100% fruit or vegetable juice counts towards your daily recommendation, the majority of the total daily amount of fruit and vegetables should come from whole fruits and vegetables to help you get enough fiber. Click on http://www.fruitsandveggiesmorematters.org/ for more information.

Source: We Can! is an effort of the the National Heart, Lung, and Blood Institute (NHLBI) in collaboration with the National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK), the National Institute of Child Health and Human Development (NICHD) and the National Cancer Institute (NCI).
Parent Tips: Healthier Eating While Saving Money (continued)

- **Buy in-season fruits and vegetables.** Use local farmer’s markets when possible—the foods are fresher and usually cost the same, if not less, because you are buying direct from the farmer.

- **Buy milk (low-fat or fat-free) in the largest containers you can handle before it spoils** (gallon or ½ gallon). Milk sold at convenience stores usually costs more than at supermarkets. (Fat-free dry milk is an inexpensive back-up choice for using milk in recipes.)

- **Buy a whole chicken and cut it up into parts** instead of buying pre-cut chicken (breast, wings, thighs, legs). Remove the skin before cooking or serving.

- **Stock up on sale items** of healthier foods that you may be able to use in a timely manner. Buy canned, frozen, or packaged foods in bulk for quality and value, but serve appropriate portions within estimated calorie needs. Buy produce, lean meats, and low-fat or fat-free milk and milk products in bulk amounts that you can eat before they spoil (refer to *We Can!* Portion Distortion for more information on appropriate portion sizes http://hp2010.nhlbi.nih.gov/portion/index.htm).

- **Use your food budget wisely.** If you spend $7 on lunch 5 days a week for a year, you will spend a total of $1,820. You can save money and calories by bringing a healthier brown bag lunch from home. (see *We Can!* Food Comparison Chart in the We Can! Resources section of the website.)

### Saving Money (and Calories) on Healthy Meals and Snacks

- **Assemble snacks at home** in small baggies using foods such as nuts and seeds, dried whole grain cereal, low-fat cheese, dried fruit, fresh vegetables and fruits, rather than buying less healthy, more expensive pre-packaged and processed snacks. Serve water, or low-fat or fat-free milk instead of calorically sweetened beverages. For more ideas on healthier snacks, you can download the Go, Slow, and Whoa Foods Chart in the *We Can!* Resources section of the website.

- **Cook once, eat twice.** Serve moderate portions of meals, avoid seconds, and freeze leftovers to enjoy later. This will help you save money and calories!

- **Do “batch cooking”** when the food budget and time allow. Cook large amounts of spaghetti sauce, divide it into family-size portions and freeze promptly for later in the month.

*Source: Adapted from “My Money-Saving Tips: A Healthier You” Based on the Dietary Guidelines for Americans, December 2006.*

*We Can!*, or “Ways to Enhance Children’s Activity & Nutrition,” is a national education program designed for families and communities to help children achieve a healthy weight. The program focuses on three important behaviors: improved food choices, increased physical activity and reduced screen time.

For more information about *We Can!* visit http://wecan.nhlbi.nih.gov or call 1-866-35-WECAN.
Mealtime Recommendations

**Babies can**
- sit at the table in a high chair;
- smile and laugh;
- notice smells, textures and colors;
- listen to sounds and voices;
- play with objects (banging, shaking, and dropping things are ways that babies play);
- put things in their mouths (watch out for dangerous objects).

**Toddlers can**
- eat finger foods;
- reach for foods;
- sit at the table in a booster seat;
- express likes and dislikes;
- hold and drink from a cup;
- assist with some simple tasks, such as table setting;
- enjoy table conversations.

**Pre-schoolers can**
- sit at the table in their own seat;
- enjoy helping with food preparation;
- express likes and dislikes;
- serve themselves;
- pour cereal and beverages (expect spills!);
- enjoy pretending to be waiter, cook;
- follow simple directions.

**School-age children can**
- express likes and dislikes;
- be more helpful with food preparation and cleanup;
- be more independent with food choices and meal planning;
- initiate conversations, tell about their day;
- understand differences in foods: what’s healthy, differences in preparation, etc.

**Teens**
- may not value family mealtime as much (be flexible, but keep trying);
- are concerned about body image;
- have more demands on time with sports/school activities (they may have less time for family meals);
- are affected by outside influences of media and peers;
- still benefit from family mealtimes.

Healthy Snack Recommendations for Children Ages 3 and Older

Examples of Quick, Healthy Snacks for Children Ages 3 and Older.

- Cereal bar or granola bar
- Light microwave popcorn or air-popped popcorn
- Crackers like Melba toast, Saltines, and reduced fat Triscuits
- Pretzels
- Toasted cinnamon raisin bread
- Rice cakes
- Graham crackers & animal crackers
- Oatmeal
- Baked tortilla chips with salsa or any baked chips
- Cereal (dry or with low-fat milk)
- Low-fat or frozen yogurt
- Low-fat milk or soy milk
- Hummus with pita or veggies
- Nuts, sunflower seeds or soy nuts
- Peanut butter, almond butter, or soy nut butter (on celery, apple, or crackers)
- Beans and tortillas
- Raw vegetables (like baby carrots) with reduced-fat ranch dressing or yogurt dip
- Celery with low-fat cream cheese
- Fresh fruit, fruit salad or dried fruit such as raisins, craisins, dried apricots
- Frozen grapes or melon
- Applesauce

Healthy Sleeping Habits

National experts recently surveyed kids about their sleep habits.

Here’s what they learned:

• 70% of kids said they wish they could get more sleep.
• 71% of kids said they feel sleepy or very sleepy when it’s time to wake up for school.
• 25% of kids said they feel tired at school every single day.

Five Tips for Bedtime

It may be a challenge to make a change to your children’s bedtime routine, but if you stick to it, your efforts will pay off. These ideas will help:

• Help your child prepare for school the night before by laying out their clothes, backpack, etc.
• Slow down and set a routine before bed.
• Make the bedroom a cozy environment where your child wants to be.
• Avoid putting a TV in your child’s bedroom; if they already have one, do not let them watch TV in their bedroom at bedtime.
• Adjust your child’s bedtime if they are not getting enough sleep.

How Much Sleep is Enough?

There’s no exact number of hours of sleep required by all kids in a certain age group, but the National Sleep Foundation suggests:

• Preschoolers (ages 3 to 5): should sleep about 11 to 13 hours per night
• School-Age Children (ages 5 to 12): need about 9 to 11 hours of sleep a night
• Teens: need at least 8.5 to 9.5 hours of sleep per night

Lifestyle Guidelines

- Limit time devoted to media use (including television/videos/video games/computer use) to no more than 1–2 hours per day.
  - Try not to use the remote control while watching television.
  - Get up and move around during television commercials.
- Discourage children younger than 2 years from watching television.
- No TV/VCRs/or video games in children’s bedrooms.
  - This is associated with an increased risk of being overweight.
- Encourage play time.
  - Toddlers and preschoolers should participate in at least 30 to 60 minutes per day of structured play.
  - At least 60 minutes per day should be dedicated to unstructured physical activity.
  - Children should not lie down for more than 60 minutes at a time except when sleeping.
- Make physical activity a part of your daily routine.
  - Walk or ride a bike to school.
  - Play outdoors, in the gym, or on the playground 30 minutes before homework every day.
  - Walk with friends instead of talking to them on the phone.
- Get 1 hour of exercise during the day.
  - Both children and adults should be active for 1 hour every day. This exercise can occur throughout the day.
  - Purchase a pedometer and aim to walk 10,000 steps a day.
- Consider participating in organized sports or physical activities.
  - Get involved in team sports or marching band at school.
  - Take classes in activities you enjoy such as dance, martial arts, swimming, or tennis, or buy an aerobics tape and exercise at home.
- Encourage your family to exercise together. Parents can be role models!
  - Take walks together.
  - Go on a family bike ride.
  - Plan trips to the zoo, museum, or library; or plan house or yard projects.
- Variety in exercise helps to avoid boredom.
  - Take into account different times of day and weather conditions.

Consejos para el estilo de vida

• Límite el tiempo dedicado al uso de la televisión, videos, videojuegos, y computadora a no más de 1 ó 2 horas al día.
  - NO use el control remoto cuando vea la televisión.
  - Haga ejercicio durante los comerciales.
• No deje que los niños menores de 2 años vean la televisión.
• NO ponga televisiones, VCR o videojuegos en las recámaras de los niños.
  - Esto promueve que vean la televisión y puede aumentar el riesgo de que sean obesos.
• Anime a los niños a que jueguen juegos tanto estructurados como libres.
  - Los niños pequeños y de kinder deben participar en un mínimo de 30 a 60 minutos de juego estructurado por día.
  - Por lo menos 60 minutos diarios deben dedicarse a actividades físicas libres.
  - Los niños no deben permanecer inactivos por más de 60 minutos seguidos excepto cuando duermen.
• Incorpore actividades físicas dentro de la rutina diaria.
  - Haga que vayan a la escuela caminando o en bicicleta.
  - Haga que jueguen al aire libre, en el gimnasio, o en el patio de recreo por 30 minutos todos los días antes de hacer la tarea.
  - Haga que salgan a caminar con sus amigos en vez de hablarles por teléfono.
• Acumulen 1 hora de actividad física durante el día.
  - Tanto los niños como los adultos deben estar activos por una hora todos los días. Esta actividad se puede acumular a lo largo del día.
  - Compre un pedómetro y tráte de caminar 10,000 pasos al día.
• Considere la participación en deportes organizados o en actividades físicas.
  - Haga que participen en deportes en equipo o en la banda musical/escolar en la escuela.
  - Haga que tomen clases de actividades que disfruten como baile, artes marciales, natación o tenis, o compre un video de aeróbics y hagan ejercicio en casa.
• Anime a los miembros de la familia a que hagan ejercicio juntos y haga que los padres pongan el ejemplo.
• Manténgase físicamente activos como familia. ¡Padres pueden ser modelos ejemplar!
  - Salgan a caminar juntos como familia.
  - Vayan en paseos de bicicleta como familia.
  - Planea actividades como paseos al zoológico, al museo o a la biblioteca, y hagan proyectos en la casa o en el jardín.
• Anime a los niños a participar en varias actividades físicas para evitar que se aburran.
  - Tome en cuenta diferentes horas del día y el estado del tiempo.

Go Walking Tips

Go Walking—Together

Life can be hectic. Why not take a walk with your children? Not only will you be able to take a break from a busy day, you’ll be starting a healthy activity that will last a lifetime.

- Make walking your “together time.” Instead of spending time in front of the TV, you and your children can go for a walk and talk about your day.

- While you’re walking, start slowly. See if you and your children are able to walk and talk easily. If you’re having a hard time talking, slow your pace down. Walking and being able to talk easily is a simple way to see how in shape you are.

- If your children are walking alone or with friends, make sure that they stick to sidewalks or an established walking path.

- Walking at sunset or after dark? Wear bright colors or something with reflective material on it.

- Even if you’re not thirsty, take water along for your walk. You and your children should make sure to drink frequently throughout the walk.

- Walking is a great way to relieve frustration. Taking a walk together can help you relieve tension, and may give you a chance to talk about a difficult situation.

- If you have friends in the neighborhood, walk by and say hello. Encourage your children to stop by instead of using the phone. You’ll not only get to see your friends and neighbors, but you’ll help your health.

- Want to make walking even more fun? Use a pedometer to count your steps and figure out how far you’ve walked. Challenge your children to do the same and see who can walk the farthest.

- Start a walking club with your extended family and friends. Encourage everyone to bring the kids and plan a weekly walking trip to a special destination.

- Work walking into your everyday life. Whether you’re running errands or going to the mall, park as far from the store entrance as possible. Then, when inside, take the stairs instead of the escalator.

- Deciding where to walk can be fun too. If you choose a place (a park, walking path, playground) you all like, you’ll be more likely to walk for a longer time and enjoy yourself.

Source: Adapted from Jump Up & Go!, a youth wellness program developed in Massachusetts
Screen Time Recommendations

Recommendation:
Cut screen time to 2 hours or less daily.

(Screen time includes television, computer & video games—usually
does not include computer time necessary for home work.)

From Who:
• The American Academy of Pediatrics recommendation is children have less than two a hours a day of
screen time.
• They also recommend keeping the TV out of the
bedroom.
• Children under the age of 2 should not have any
at all while ages 3–5 should have less than an hour.

Why—The Reason:
• Watching television occupies many children for sev-
eral hours each day, and is associated with physical
inactivity, increased energy intake (sitting in front of
the TV many children snack more than they should),
and increased obesity.
• Too much TV has been linked to lower reading
scores and attention problems.

Tips to Tame the TV:
Set Limits: Know how much TV your child is watching.
• Set some basic rules such as no television before
homework or chores are done.
• Do not watch TV during mealtime.
• Negotiate rules and weekly plans with your children.
• Choose specific shows to watch; don’t just have
the TV on as a constant background.
• Use a timer and when the bell rings its time to turn
off the TV or eliminate TV time during the week.

Participate: Don’t put computers and TV’s in your
child’s room.
• Having the TV in a common room makes watching
a family activity.
• Watch TV with your child and discuss the program.
Ask them questions and express your views.
• This will also let you know what your children
are watching.

Monitor: Encourage children to watch programs about
characters who show cooperation and caring.
• Having kids keep a journal recording the amount
of TV watched helps them see how much time
they spend in front of the television instead of other
activities they enjoy.

Analyze Commercials: Help children to critically evaluate
advertisements and recognize exaggerated claims.
• Limit the number of commercials seen by recording
shows and then fast-forwarding through them.
This will also help maximize the allowed TV time.

Be a Good Role Model & Create Alternatives: Follow
your own rules. Because children model behavior, set
a good example with your own television viewing habits.
Avoid watching programs containing adult content
when your child is in the room or nearby.

Have children help with dinner. It gets them involved and
shows them helping is important.

Put on music and let the kids dance.

Every time you turn on the TV, you see commercials,
right? (More than 40,000 a year). Companies pay big
money to get their ads on TV—just so we will see them.

In 1999, advertisers spent over 13 billion dollars (WOW)
on advertising.

When we see their products, we are more likely to buy
them or ask for them. Think about many of the new
products you have tried lately, where did you get the
idea that you had to have them? Hmmm….I bet you’ve
seen commercials for at least some of these things.
YIKES! Maybe those advertisers gotcha.

Now advertisers are getting really smart and promoting
their products in the shows we watch. Next time look at
what your favorite character is eating or drinking. Do you
recognize the brand?

Some Stats:
• By the time you are 65, you will have seen about
2 million ads on TV.
• By the time a child is 18, they will have seen more
than 200,000 violent acts on TV.
• The number of programs with sexual content has
doubled since 1998.
• Children who watch more than 10 hours per week
of TV are less likely to do well in school.

Source: Adapted from Growing Healthy Kids—Nemours Health & Prevention Services
Physical Activity Recommendations

**Recommendation:**
Participate in at least 1 hour or more of moderate physical activity every day & 20 minutes of vigorous activity at least 3 times a week.

*Moderate intensity physical activity is defined as hiking or dancing while vigorous activities include running, aerobics, basketball etc. Either type of activity should increase heart rate.*

**From Who:**
- Key recommendations from the 2005 Dietary Guidelines for Americans from the US Department of Health & Human Services, Department of Agriculture state that children and adolescents should engage in at least one hour of moderate physical activity on most, preferably all days of the week.

**Why—The Reason:**
- While most school age children are quite active, physical activity sharply declines during adolescence.
- Children who are raised in families with active lifestyles are more likely to stay active as adults than children raised in families with sedentary lifestyles.
- Learning to be physically active as children will help them grow into healthy adults.
- Regular physical activity is essential for weight maintenance and prevention of chronic diseases such as heart disease, diabetes, colon cancer and osteoporosis.
- Physical activity can provide energy and help you feel better when you are sad or worried.

**Strategies to Help Increase Physical Activity and …Remember to Keep Physical Activity Fun!**
- Encourage “30 minute” rule for inactivity—i.e. don’t allow kids to sit for more than 30 minutes without moving.
- Encourage kids and adults to be active after prolonged periods of inactivity—i.e. encourage them to be active for 30 minutes after school (or work) before sitting to begin homework. Fit physical activity/play into your schedule every day.
- Walk while talking on your cell phone. Take a family walk after dinner.
- Encourage “weekend rule”—i.e. encourage some type of physical activity for at least 30 minutes of each day of the weekend.
- Increase daily activity levels (park further from door, take the stairs instead of an elevator & plan family activities that involve walking—a hike or visit to a local park or museum).
- Turn off the TV and keep the TV out of your bedroom.
- Limit recreational computer time.
- Use a pedometer and keep track of your steps—aim for 10,000 steps a day.
- Act as role model and be a good example. Keep sports equipment in your trunk so you are ready to play anytime!

Most people know what physical activity is, but do you know why it is so important?

- It isn’t so you can look all sweaty like people on TV commercials for equipment. And it isn’t so you can have huge muscles to bust out of your clothes like a superhero, either.

- Physical activity is important because it keeps people’s bodies—and minds—healthy. Without it, we wouldn’t feel or look very good.

Actually, there are so many reasons why physical activity is good for you; it’s time to get right into it and see why it’s cool to be fit!

**Reason # 1: Physical Activity Makes You Feel Good**

- Being physically active is a most excellent way to feel happy, whether you do it on your own or with a group.

- Plus, when you’re breathing deeply during physical activity and bringing more air into your lungs, your brain likes the extra oxygen. And when you’re active and running around, sometimes it’s hard to think about what was bothering you.

**Reason # 2: Physical Activity Helps Keep Your Weight Healthy**

- Every time you eat food; your body does the same thing: it “eats” the nutrients in the food as fuel. It burns these nutrients, or calories, to give you energy. But if the body isn’t able to use all the calories that are coming from food, it stores them away as fat.

- Physical activity helps keep your weight right for your height by burning up extra calories. When you are physically active, your body uses that extra fuel to keep you going strong.

**Reason # 3: Physical Activity Makes Your Heart Happy**

- Your heart is the hardest-working muscle in your body. Its #1 job is to pump blood through your body every day of your life! Since it can’t lift weights to get stronger, it needs you to do aerobic physical activity.

- Aerobic is a fancy word for needing oxygen and aerobic physical activity is any kind of activity that makes your muscles use oxygen. When you do aerobic physical activity and bring in that oxygen, your heart becomes stronger (and even a tiny bit bigger!).

**Reason # 4: Physical Activity Makes You Stronger**

- All the muscles in your body do a fine job when you use them for easy stuff, like picking up a book or walking down the stairs. But what about using them for harder stuff, like taking long bike rides, climbing a tree or carrying your backpack to class? That’s where physical activity comes in: it makes your muscles get stronger and sometimes larger. As your muscles get stronger, you can do more active things for longer periods of time.

- And strong muscles also help protect you from injuries when you play, because they give better support to your joints (where your bones meet).

**Reason # 5: Physical Activity Makes You Flexible**

- Can you touch your toes easily without yelling “ouch”? If so, you’re pretty flexible, which means you can bend and stretch your body without too much trouble. But as people get older they tend to get less flexible, so that’s why it’s important to be active when you’re a kid—to stay flexible.

- Plus, when you’re flexible, you can play harder without having to worry about getting sprained and strained muscles.
A Menu for Action—Physical Activity and Nutrition Survey Management Plan

Are You a Healthy Kid?

Patient Name __________________________ Age ________ Date ______________

While you are waiting to see your clinician, please take a moment to answer questions 1–10 below. For each of the following questions, check “yes” or “no.”

Yes No

1. Do you eat five or more fruits and vegetables per day?    □ □
2. Do you have a favorite fruit or vegetable that you eat every day?    □ □
3. Do you eat breakfast every day?    □ □
4. Do you watch TV, videos, or play computer games for two hours or less per day?    □ □
5. Do you take gym class or participate in sports or dance in or outside of school three or more times a week?    □ □
6. Do you have a favorite sport or physical activity that you love to do?    □ □
7. Do you eat dinner at the table with your family at least once a week?    □ □
8. Do you have a TV in your bedroom?    □ □
9. Do you eat in front of the TV?    □ □
10. Do you drink more than one soda, juice, or other sugar-sweetened drink a week?    □ □

5-2-1 Daily Prescription for Better Health (to be completed by clinician)

Height ________ Weight ________ BMI ________ BMI Percentile ________

Healthy Lifestyle Goal Setting Worksheet

Healthy Lifestyle Goal Setting Worksheet

It is important for your medical team to know how ready you are to make changes to improve your health. The following information can help you and your provider talk about steps you can take to move toward a healthier lifestyle for you and your family.

On a scale of 0 (not ready) to 10 (very ready) how ready are you to consider making a change?

0  1  2  3  4  5  6  7  8  9  10

(please circle appropriate number)

Ideas for Change

5—Eat at least 5 servings of fruits and vegetables on most days.
   - Try one new vegetable or fruit each week
   - Add fruit to my cereal everyday
   - Choose a fruit for a snack
   - Change from fruit juice to whole fruit
   - Switch sweets to fruit

2—Reduce screen time to 2 hours or less every day
   - Plan my TV time
   - Take the TV out of my bedroom
   - Don’t eat in front of the TV

1—Participate in at least 1 hour or more of physical activity every day
   - Take a walk or enjoy a family walk after dinner
   - Play my favorite sport or physical activity
   - Wear a pedometer & walk 10,000 steps a day
   - Obtain physical activity equipment to try something new

0—Limit soda, sugar sweetened drinks and whole milk
   - Drink no soda
   - Limit fruit and sports drinks
   - Switch to low-fat or skim milk
   - Drink more water

Other: Familiarize myself with portion sizes
   - Eat two family meals together each week
   - Eat breakfast
   - Eat no fast/junk food
   - Limit snacks after dinner

My child’s personal health goal is to: ____________________________________________

When I/my child reach goal I/my child will be rewarded by: ____________________________________________

(ideas might be a special privilege, attend an event, do a special activity)

Weekly Meal Planner (continued)

Suggestions for Healthier Breakfasts:
- 1 cup whole grain cold cereal or ½ cup hot cereal, ½ cup fat-free or low-fat milk, and ½ cup fresh or frozen fruit such as blueberries, strawberries, or bananas.
- 2 slices whole grain toast with 2 tablespoons jam or peanut butter, 1 cup low-fat or fat-free yogurt, and ½ cup 100% juice (orange, grapefruit, etc.)
- 2 scrambled eggs, 2 slices whole grain toast with jam, ½ cup sliced strawberries.
- Tortilla with melted low-fat cheese, 2 scrambled eggs or ½ cup egg substitute, ½ cup spinach, and ¼ cup salsa.

Suggestions for Healthier Lunches:
- 1 cup garden salad with 1 tablespoon light dressing and ½ turkey sandwich on whole grain bread with lettuce, tomato, and mustard.
- 1 cup broth or tomato-based soup and ½ lean roast beef sandwich on whole grain bread with lettuce, tomato, and mustard.
- 1 slice cheese or vegetable pizza made with low-fat cheese, small garden salad, and 2 tablespoons of light dressing.

Suggestions for Healthier Dinners:
- 3 ounces grilled honey mustard chicken, ½ cup roasted asparagus, and 1 cup wild rice.
- 3 ounces baked fish with lemon dill dressing, 1 cup herbed pasta, and 1 cup garden salad with 2 tablespoons light dressing.
- 1 cup pasta with ½ cup tomato sauce, and ½ cup steamed broccoli, 1 slice whole grain bread, and ½ cup pineapple slices.

Your Weekly Log

Growing Up Healthy and Strong Is as Easy as 5-2-1!

5—Record the servings of fruits and veggies you eat each day. 5 or more each day is the healthy way.

2—Limit your screen time; try not to guess—you’ll be a success if it’s 2 hours or less.

1—Add up your time to get the activity score—get 1 hour or more to build a strong core.

Track your progress every day. Record each amount in the chart below and show when you drink soda and other sugar-sweetened beverages.

Reduce Children’s Screen Time Log

Print and complete this log to determine how much time you are spending in front of a screen. Help your family do the same. Place the log in an easy location for everyone to use and see, such as near the family television, by the computer, or on the refrigerator. If screen time for you or your family members is less than 2 hours a day, pat yourselves on the back! If it’s 2 hours or more, then check out the Get Moving section to help you reduce your screen time and switch to some physically active alternatives.

Goal Tracker: My Goal Is to Eat More Fruits and Veggies

Date _____________________

Circle the number of fruits & vegetables that you ate today. One serving equals a medium-sized fruit (apple, banana, pear, etc.), a 1/2 cup of cut fruit or cooked veggies (about the size of a tennis ball), or 1 cup of raw veggies (about the size of a softball).

Monday: 1 2 3 4 5
Tuesday: 1 2 3 4 5
Wednesday: 1 2 3 4 5
Thursday: 1 2 3 4 5
Friday: 1 2 3 4 5
Saturday: 1 2 3 4 5
Sunday: 1 2 3 4 5

Tips:
- **Be prepared.** Keep washed, ready-to-eat produce on hand so it’s always available.
- **Be creative.** Add diced tomatoes, carrots, broccoli, onions, and mushrooms to sauces, pizza, soups, and casseroles.
- **Be a role model.** Other family members are more likely to eat fruits and vegetables if they see you eating them.
- **Don’t give up.** You may need to see or taste a food 7–10 times before you like it.

My favorite fruit or vegetable that I ate this week was _____________________

A new fruit or vegetable that I want to try next week is _____________________

## Goal Tracker: My Goal Is to Be More Physically Active

Date _______________________

Circle the number of hours that you were moderately or vigorously physically active today. This includes any activities that you participated in such as sporting events, family walks or bike rides, outdoor activities, etc. where you broke into a sweat.

<table>
<thead>
<tr>
<th>Day</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Monday</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Tuesday</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Wednesday</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Thursday</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Friday</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Saturday</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Sunday</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Tips:
- **Every step counts!** Take the stairs instead of the elevator and/or walk anywhere you can instead of riding in a car.
- **Be active as a family.** Make activities, such as walks and bike rides, part of your daily routine.
- **Turn off the tube.** Substitute physical activity for one hour of TV each day.
- **Join a team.** Group sports are a great way to get involved and moving.

My favorite physical activity that I did this week was ________________________

A new physical activity that I can try next week is ________________________

Goal Tracker: My Goal Is to Drink More Water and Less Soda and Juice

Date __________________

Circle the number of glasses of water that you drank today. 1 serving equals 8 ounces or 1 cup.

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Monday</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Tuesday</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
</tr>
<tr>
<td>Wednesday</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
</tr>
<tr>
<td>Thursday</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
</tr>
<tr>
<td>Friday</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
</tr>
<tr>
<td>Saturday</td>

<td>4</td>
<td>5</td>
</tr>
<tr>
<td>Sunday</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
<td>5</td>
</tr>
</tbody>
</table>

**Tips:**

- **Mix half water and half juice.** This way you can enjoy the flavor with only half of the sugar.
- **Pass on the soda.** Don’t have it around. It has no nutritional value, adds calories to your diet, increases the occurrence of cavities, and may increase your risk for bone fractures later in life.
- **Water is the best choice!** Not only is it the most healthful drink, it is also the cheapest.

Water makes me feel good because ____________________________________________

Goal Tracker: My Goal Is To Watch Less TV

Date __________________

Circle the number of hours that you had any type of screen time. This includes watching TV, movies, playing video games, or using the computer.

Monday  1  2  3  4  5  
Tuesday  1  2  3  4  5  
Wednesday  1  2  3  4  5  
Thursday  1  2  3  4  5  
Friday  1  2  3  4  5  
Saturday  1  2  3  4  5  
Sunday  1  2  3  4  5  

**Tips:**

- **Turn off the tube.** Substitute physical activity for one hour of TV viewing each day.
- **Try something new.** Pick a new activity that you can do once a week instead of watching TV. Trips to the library, museum, local pool, or farmers market are great ideas.
- **Tune into dinner not the TV.** Do not watch TV during mealtimes. Instead focus on eating together as a family.
- **Keep it out of the bedroom.** Do not have a TV in your bedroom.

Instead of watching TV this week, I ________________________________

Another activity that I could do other than watch TV is ________________________________
Willingness/Importance? And Confidence Scales

**Willingness/Importance?**
On a scale of 0—10, how willing/important is it to you to make a change toward a healthier lifestyle?

<table>
<thead>
<tr>

</table>

What would make you more confident?

What might your next steps be?

What is your plan?

Source: Maine Center for Public Health. Adapted With Kind Permission.
**Glossary**

**Abdominal fat**: Fat (adipose tissue) that is centrally distributed between the thorax and pelvis and that induces greater health risk.

**Adipose tissue**: (body fat or fat) Connective tissue composed of adipocytes. Its main role is to store energy which can be burned to meet the energy needs of the body, although it also cushions and insulates the body. Adipose tissue contains many small blood vessels. In the skin, it accumulates in the deepest level, the subcutaneous layer, providing insulation from heat and cold. Around organs, it provides protective padding.

**Aerobic exercise**: A type of physical activity that improves the use of oxygen in the body and includes walking, jogging, running, and dancing. Aerobic training improves the efficiency of the aerobic energy-producing systems that can improve cardio-respiratory endurance.

**Age-adjusted**: Summary measures of rates of morbidity or mortality in a population using statistical procedures to remove the effect of age differences in populations that are being compared. Age is probably the most important and the most common variable in determining the risk of morbidity and mortality.

**Anaerobic exercise**: A type of high-intensity, short-duration exercise, such as weightlifting, that doesn’t require large amounts of oxygen to burn energy and that athletes use to build body mass.

**Anorexiant**: A drug, process, or event that leads to anorexia.

**Anthropometric measurements**: Measurements of human body height, weight, and size of component parts, including skinfold measurement. Used to study and compare the relative proportions under normal and abnormal conditions.

**Bariatric surgery**: Surgery that is performed for the treatment of morbidly obese individuals. This type of surgery is also known as obesity surgery and weight loss surgery.

**Blood glucose**: Simple blood sugar that is the body’s main source of energy. A blood test for glucose is used to evaluate blood sugar levels and results may be used to diagnose diabetes, monitor diabetic control or for screening purposes.

**Blood pressure**: Pressure of the blood on the walls of the blood vessels that is measured in two numbers.

**BMI**: see Body mass index.

**Body composition**: The ratio of lean body mass (structural and functional elements in cells, body water, muscle, bone, heart, liver, kidneys, etc.) to body fat (essential and storage) mass. Essential fat is necessary for normal physiological functioning (e.g., nerve conduction). Storage fat constitutes the body’s fat reserves, the part that people try to lose.

**Body Mass Index (BMI)**: Is a mathematical calculation involving height and weight. BMI is calculated by dividing a person’s body weight in kilograms by their height in meters squared (weight [kg] height [m]^2) or by using the conversion with pounds (lbs) and inches (in) squared as shown below. This number can be misleading, however, for very muscular people, or for pregnant or lactating women.

\[
\text{Weight (kg)} \div \text{height (m)}^2
\]

or

\[
\left[\frac{\text{Weight (lbs)}}{\text{height (in)}^2}\right] \times 703 = \text{BMI}
\]

**Calcium**: Important mineral for the growth, maintenance and reproduction of human cells.

**Calorie**: The calorie is a pre-SI metric unit of energy. The unit was first defined by Professor Nicolas Clément in 1824 as a unit of heat. This definition entered French and English dictionaries between 1841 and 1867. In most fields its use is archaic, having been replaced by the SI unit of energy, the joule. However, in many countries it remains in common use as a unit of food energy.

The definition of calorie is based on the specific heat capacity of water. The gram calorie, approximately 4.2 J, is based on one gram of water. The kilogram calorie, equal to one thousand gram calories, is based on one kilogram of water. In the context of nutrition, and especially food labeling, this larger unit is used and referred to interchangeably by the terms calorie (or Calorie) and kilocalorie. The kilogram calorie, large calorie, food calorie, Calorie (capital C) is the amount of energy required to raise the temperature of one kilogram of water by one degree Celsius.

**Cancer**: Cancer involves the uncontrolled growth of abnormal cells that have mutated from normal tissues. These cells prevent normal function of vital organs, damaging essential systems.

**Carbohydrates**: A carbohydrate is an organic compound with the general formula C\(_n\)(H\(_2\)O\(_n\))., that is, consists only of carbon, hydrogen and oxygen, with the last two in the 2:1 atom ratio. The carbohydrates (saccharides) are divided into four chemical groupings: monosaccharides, disaccharides, oligosaccharides, and polysaccharides. Carbohydrates perform numerous roles in living things. Polysaccharides serve for the storage of energy and as structural components. The 5-carbon monosaccharide ribose is an important component of coenzymes and the backbone of the genetic molecule known as RNA. In food, carbohydrates often means any food that is particularly rich in starch (such as cereals, bread and pasta) or sugar (such as candy, jams and desserts) and supplies 4 calories/gram.
Glossary (continued)

**Cardiovascular disease (CVD):** Any abnormal condition characterized by dysfunction of the heart and blood vessels. CVD includes atherosclerosis (especially coronary heart disease, which can lead to heart attacks), cerebrovascular disease (e.g., stroke), and hypertension (high blood pressure).

**Central fat distribution:** The waist circumference is an index of body fat distribution. Increasing waist circumference is accompanied by increasing frequencies of overt type 2 diabetes, dyslipidemia, hypertension, coronary heart disease, stroke, and early mortality.

**Cholesterol:** A soft, waxy substance manufactured by the body and used in the production of hormones, bile acid, and vitamin D and present in all parts of the body, including the nervous system, muscle, skin, liver, intestines, and heart. Blood cholesterol circulates in the bloodstream. Dietary cholesterol is found in foods of animal origin. Total blood cholesterol levels above 240 mg/dl are considered high. Levels between 200–239 mg/dl are considered borderline high. Levels under 200 mg/dl are considered desirable.

**Cimetidine:** A weight loss drug that is thought to work by suppression of gastric acid or suppression of hunger by blocking histamine H2 receptors. It is not approved by the FDA.

**Comorbidity:** Two or more diseases or conditions existing together in an individual.

**Complex carbohydrate:** Starch and dietary fiber.

**Congestive heart failure (CHF):** Congestive heart failure is a condition in which the heart's function as a pump is inadequate to meet the body's needs.

**Computed tomography (CT) scans:** A radiographic technique for direct visualization and quantification of fat that offers high image contrast and clear separation of fat from other soft tissues. CT can estimate total body adipose tissue volume and identify regional, subcutaneous, visceral, and other adipose tissue depots. Radiation exposure, expense, and unavailability restrict the epidemiologic use of CT.

**Coronary heart disease (CHD):** A type of heart disease caused by narrowing of the coronary arteries that feed the heart, which needs a constant supply of oxygen and nutrients carried by the blood in the coronary arteries. When the coronary arteries become narrowed or clogged by fat and cholesterol deposits and cannot supply enough blood to the heart, CHD results.

**Dexfenfluramine:** A serotonin agonist drug used to treat obesity. FDA approval has been withdrawn.

**Diabetes:** A complex disorder of carbohydrate, fat, and protein metabolism that is primarily a result of relative or complete lack of insulin secretion by the beta cells of the pancreas or a result of defects of the insulin receptors.

**Diastolic blood pressure:** The minimum pressure that remains within the artery when the heart is at rest.

**Diet:** What a person eats and drinks. Any type of eating plan.

**Diethylpropion:** An appetite suppressant prescribed in the treatment of obesity.

**Dietary fiber:** Plant food components, including plant cell walls, pectins, gums, and brans that cannot be digested.

**Digestion:** Digestion is the mechanical and chemical breaking down of food into smaller components. Food enters the mouth, being chewed by teeth, with chemical processing beginning with chemicals in the saliva from the salivary glands. Then it travels down the esophagus into the stomach, where acid both kills most contaminating microorganisms and begins mechanical break down of some food and chemical alteration of some for subsequent absorption or excretion.

**Dopamine:** A catecholamine neurotransmitter that is found primarily in the basal ganglia of the central nervous system. Major functions include the peripheral inhibition and excitation of certain muscles; cardiac excitation; and metabolic, endocrine and central nervous system actions.

**Dual energy X-ray absorbiometry (DEXA):** A method used to estimate total body fat and percent of body fat. Potential disadvantages include whole body radiation.

**Dyslipidemia:** Disorders in the lipoprotein metabolism; classified as hypercholesterolemia, hypertriglyceridemia, combined hyperlipidemia, and low levels of high-density lipoprotein (HDL) cholesterol. All of the dyslipidemias can be primary or secondary. Both elevated levels of low-density lipoprotein (LDL) cholesterol and low levels of HDL cholesterol predispose to premature atherosclerosis.

**Efficacy:** The extent to which a specific intervention, procedure, regimen, or service produces a beneficial result under ideal conditions. Ideally, the determination of efficacy is based on the results of a randomized control trial.
**Glossary (continued)**

**Energy balance:** Energy balance is the state in which the total energy intake equals total energy needs.

**Energy deficit:** A state in which total energy intake is less than total energy need.

**Energy expenditure:** The amount of energy, measured in calories, that a person uses. Calories are used by people to breathe, circulate blood, digest food, and be physically active.

**Ephedrine:** A sympathomimetic drug that stimulates thermogenesis in laboratory animals and humans. Animal studies show that it may reduce fat content and, therefore, body weight by mechanisms that probably involve increased expenditure and reduced food intake.

**Esophagus:** When you swallow food, muscle action brings the food down your esophagus, or food pipe, and empties through a one-way valve into the stomach.

**Extreme obesity:** A body mass index ≥99th percentile BMI for age is considered severely obese and a BMI ≥40 is considered morbidly obese in children and adolescents.

**Fat:** With proteins and carbohydrates, fat, also known as lipid, is one of the three types of nutrients used as energy sources by the body. The energy produced by fats is nine calories per gram. Proteins and carbohydrates each provide four calories per gram. Hence, fat is more than twice as caloric as protein and carbohydrate.

**Fatty acids:** Fatty acids supply energy and promote absorption of fat-soluble vitamins. Some fatty acids are “essential,” because they cannot be made by the body.

**Femoxetine:** A selective serotonin reuptake inhibitor drug used in obese patients for weight loss.

**Fenfluramine:** A serotonin agonist drug used in the treatment of obesity. FDA approval has been withdrawn.

**Fibrinogen:** A plasma protein that is converted into fibrin by thrombin in the presence of calcium ions. Fibrin is responsible for the semisolid character of a blood clot.

**Fluoxetine:** An antidepressant drug used to promote weight loss whose action is mediated by highly specific inhibition of serotonin reuptake into presynaptic neurons. Serotonin acts in the brain to alter feeding and satiety by decreasing carbohydrate intake, resulting in weight reduction.

**Gallbladder:** The gallbladder is attached underneath the liver; it stores and concentrates bile. When food enters the stomach, it ‘signals’ the gallbladder to squeeze out bile into the duodenum for digestion.

**Gallstones:** Constituents in the gallbladder that are not reabsorbed, including bile salts and lipid substances such as cholesterol that become highly concentrated. They can cause severe pain (obstruction and cramps) as they move into the common bile duct. Risk factors for cholesterol gallstone formation include female gender, weight gain, overweight, high energy intake, ethnic factors (Pima Indians and Scandinavians), use of certain drugs (clofibrate, estrogens, and bile acid sequestrants), and presence of gastrointestinal disease. Gallstones sometimes develop during dieting for weight reduction. There is an increased risk for gallstones and acute gallbladder disease during severe caloric restriction.

**Gastric banding:** Surgery to limit the amount of food the stomach can hold by closing part of it off. A band made of special material is placed around the stomach near its upper end, creating a small pouch and a narrow passage into the larger remainder of the stomach.

**Gastric bypass:** A surgical procedure that combines the creation of small stomach pouches to restrict food intake and the construction of bypasses of the duodenum and other segments of the small intestine to cause food malabsorption. Patients generally lose two-thirds of their excess weight after 2 years.

**Gastric exclusion:** Same as gastric partitioning and Roux-en Y bypass. A small stomach pouch is created by stapling or by vertical banding to restrict food intake. A Y-shaped section of the small intestine is attached to the pouch to allow food to bypass the duodenum as well as the first portion of the jejunum.

**Gastric partitioning:** See gastric exclusion.

**Gastroplasty:** See also jejuno-ileostomy. A surgical procedure that limits the amount of food the stomach can hold by closing off part of the stomach. Food intake is restricted by creating a small pouch at the top of the stomach where the food enters from the esophagus. The pouch initially holds about 1 ounce of food and expands to 2–3 ounces with time. The pouch’s lower outlet usually has a diameter of about 1/4 inch. The small outlet delays the emptying of food from the pouch and causes a feeling of fullness.

**Genotype:** The entire genetic makeup of an individual. The fundamental constitution of an organism in terms of its hereditary factors. A group of organisms in which each has the same hereditary characteristics.

**Glucose:** A building block for most carbohydrates. Digestion causes carbohydrates to break down into glucose. After digestion, glucose is carried in the blood and goes to body cells where it is used for energy or stored.
Glossary (continued)

**Glucose tolerance:** The power of the normal liver to absorb and store large quantities of glucose and the effectiveness of intestinal absorption of glucose. The glucose tolerance test is a metabolic test of carbohydrate tolerance that measures active insulin, a hepatic function based on the ability of the liver to absorb glucose. The test consists of ingesting 100 grams of glucose into a fasting stomach; blood sugar should return to normal in 2 to 21 hours after ingestion.

**Gout and hyperuricemia:** Gout is a condition that results from crystals of uric acid depositing in tissues of the body. Gout is characterized by an overload of uric acid in the body and recurring attacks of joint inflammation (arthritis). Chronic gout can lead to deposits of hard lumps of uric acid in and around the joints, decreased kidney function, and kidney stones.

**Heart disease:** Heart disease is any disorder that affects the heart’s ability to function normally. The most common cause of heart disease is narrowing or blockage of the coronary arteries, which supply blood to the heart.

**Heartburn:** Heartburn is a painful burning sensation in the esophagus, just below the breastbone. The pain often rises in your chest and may radiate to your neck or throat.

**Hemoglobin A1c:** Glycosylated hemoglobin is formed when linkages of glucose and related monosaccharides bind to hemoglobin A and its concentration represents the average blood glucose level over the previous several weeks. HbA1c levels are used as a measure of long-term control of plasma glucose (normal, 4 to 6 percent). In controlled diabetes mellitus, the concentration of glycosylated hemoglobin A is within the normal range, but in uncontrolled cases the level may be 3 to 4 times the normal concentration. Generally, complications are substantially lower among patients with HbA1c levels of 7 percent or less than in patients with HbA1c levels of 9 percent or more.

**Hemorrhagic stroke:** A disorder involving bleeding within ischemic brain tissue. Hemorrhagic stroke occurs when blood vessels that are damaged or dead from lack of blood supply (infarcted), located within an area of infarcted brain tissue, rupture and transform an “ischemic” stroke into a hemorrhagic stroke. Ischemia is inadequate tissue oxygenation caused by reduced blood flow; infarction is tissue death resulting from ischemia. Bleeding irritates the brain tissues, causing swelling (cerebral edema). Blood collects into a mass (hematoma). Both swelling and hematoma will compress and displace brain tissue.

**Heritability:** The proportion of observed variation in a particular trait that can be attributed to inherited genetic factors in contrast to environmental ones.

**High blood pressure:** High blood pressure is measured in millimeters of mercury (mm Hg). Hypertension (high blood pressure) is when your blood pressure frequently goes over 140/90 mm Hg.

About 1 in every 5 adults in the U.S. has high blood pressure. High blood pressure occurs more often in men than in women. In addition, African Americans are affected almost twice as much as Caucasians. The prevalence of hypertension in overweight U.S. adults is 22.1 percent for men with a BMI greater than 25 and less than 27; 27.0 percent for men with a BMI greater than 27 and less than 30; 27.7 percent for women with a BMI greater than 25 and less than 27; and 32.7 percent for women with a BMI greater than 27 and less than 30.

**High-density lipoproteins (HDL):** Lipoproteins that contain a small amount of cholesterol and carry cholesterol away from body cells and tissues to the liver for excretion from the body. Low-level HDL increases the risk of heart disease, so the higher the HDL level, the better. The HDL component normally contains 20 to 30 percent of total cholesterol, and HDL levels are inversely correlated with coronary heart disease risk.

**Hirsutism:** Presence of excessive body and facial hair, especially in women; may be present in normal adults as an expression of an ethnic characteristic or may develop in children or adults as the result of an endocrine disorder.

**Hypercholesterolemia (high blood cholesterol):** Cholesterol is the most abundant steroid in animal tissues, especially in bile and gallstones. The relationship between the intake of cholesterol and its manufacture by the body to its utilization, sequestration, or excretion from the body is called the cholesterol balance. When cholesterol accumulates, the balance is positive; when it declines, the balance is negative. In 1993, the NHLBI National Cholesterol Education Program (NCEP) Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults issued an updated set of recommendations for monitoring and treatment of blood cholesterol levels. The NCEP guidelines recommended that total cholesterol levels and subfractions of high-density lipoprotein (HDL) cholesterol be measured beginning at age 20 in all adults, with subsequent periodic screenings as needed. Even in the group of patients at lowest risk for coronary heart disease (total cholesterol 200 mg/dL and HDL 35 mg/dL), the NCEP recommended that rescreening take place at least once every 5 years or upon physical examination.

**Hypertension:** High blood pressure (i.e., abnormally high blood pressure tension involving systolic and/or diastolic levels). The Sixth Report of the Joint National Committee on Prevention, Detection, Evaluation, and Treatment of High Blood Pressure defines hypertension as a systolic blood pressure of 140 mm Hg or greater, a diastolic blood pressure of 90 mm Hg or greater, or taking hypertensive medication. The cause may be adrenal, benign, essential, Goldblatt’s, idiopathic, malignant PATE, portal, postpartum, primary, pulmonary, renal or renovascular.
Glossary (continued)

**Hypertriglyceridemia:** An excess of triglycerides in the blood that is an autosomal dominant disorder with the phenotype of hyperlipoproteinemia, type IV. The National Cholesterol Education Program defines a high level of triglycerides as being between 400 and 1,000 mg/dL in adults.

**Incidence:** The rate at which a certain event occurs (i.e., the number of new cases of a specific disease occurring during a certain period).

**Insulin:** Hormone that helps the body use glucose for energy. A hormone in the body that helps move glucose (sugar) from the blood to muscles and other tissues. Insulin controls blood sugar levels.

**Insulin-dependent diabetes mellitus (type I diabetes):** A disease characterized by high levels of blood glucose resulting from defects in insulin secretion, insulin action, or both. Autoimmune, genetic, and environmental factors are involved in the development of type I diabetes.

**Ischemic stroke:** A condition in which the blood supply to part of the brain is cut off. Also called “plug-type” strokes. Blocked arteries starve areas of the brain controlling sight, speech, sensation, and movement so that these functions are partially or completely lost. Ischemic stroke is the most common type of stroke, accounting for 80 percent of all strokes. Most ischemic strokes are caused by a blood clot called a thrombus, which blocks blood flow in the arteries feeding the brain, usually the carotid artery in the neck, the major vessel bringing blood to the brain. When it becomes blocked, the risk of stroke is very high.

**Large Intestine:** Also known as the large bowel, most fluids are absorbed in the large intestine. The leftover waste products from food digestion are concentrated and passed through the rectum as stool.

**Lipoprotein:** Protein-coated packages that carry fat and cholesterol throughout the bloodstream. There are four general classes: high-density, low-density, very low-density, and chylomicrons.

**Liver:** The liver produces bile—an important chemical aiding digestion. Bile drains into the gallbladder where it is stored until needed for digestion.

**Longitudinal study:** Also referred to as a “cohort study” or “prospective study”; the analytic method of epidemiologic study in which subsets of a defined population can be identified who are, have been, or in the future may be exposed or not exposed, or exposed in different degrees, to a factor or factors hypothesized to influence the probability of occurrence of a given disease or other outcome. The main feature of this type of study is to observe large numbers of subjects over an extended time, with comparisons of incidence rates in groups that differ in exposure levels.

**Low-calorie diet (LCD):** Caloric restriction of about 800 to 1,500 calories (approximately 12 to 15 kcal/kg of body weight) per day in adults.

**Low-density lipoprotein (LDL):** (Also known as “bad cholesterol.”) A lipoprotein that contains most of the cholesterol in the blood. LDL carries cholesterol to the tissues of the body, including the arteries. A high level of LDL increases the risk of heart disease. LDL typically contains 60 to 70 percent of the total serum cholesterol and both are directly correlated with CHD risk.

**Lower-fat diet:** An eating plan in which 30 percent or less of the day’s total calories are from fat.

**Macronutrients:** Nutrients in the diet that are the key sources of energy, namely protein, fat, and carbohydrates.

**Magnetic resonance imaging (MRI):** Magnetic resonance imaging uses radio frequency waves to provide direct visualization and quantification of fat. The sharp image contrast of MRI allows clear separation of adipose tissue from surrounding nonlipid structures. Essentially the same information provided by CT is available from MRI, including total body and regional adipose tissue, subcutaneous adipose, and estimates of various visceral adipose tissue components. The advantage of MRI is its lack of ionizing radiation and hence its presumed safety in children, younger adults, and pregnant women. The minimal present use of MRI can be attributed to the expense, limited access to instrumentation, and long scanning time.

**Metabolism:** The sum total of all the chemical reactions that go on in living cells. All of the processes that occur in the body that turn the food you eat into energy your body can use.

**Morbid obesity:** A magnitude of obesity that qualifies someone for surgical treatment. Weight criteria are approximately 100 pounds or more over ideal body weight, or a BMI of 40 or higher.

**Mianserine:** An antidepressant sometimes used in the pharmacotherapy of bulimia nervosa.

**Midaxillary line:** An imaginary vertical line that passes midway between the anterior and posterior axillary (armpit) folds.

**Monounsaturated fat:** An unsaturated fat that is found primarily in plant foods, including olive and canola oils. Monounsaturated fat is found in canola oil, olives and olive oil, nuts, seeds, and avocados. Eating food that has more monounsaturated fat instead of saturated fat may help lower cholesterol and reduce heart disease risk. However, it has the same number of calories as other types of fat, and may still contribute to weight gain if eaten in excess.
**Glossary (continued)**

**Myocardial infarction (MI):** Gross necrosis of the myocardium as a result of interruption of the blood supply to the area; it is almost always caused by atherosclerosis of the coronary arteries, upon which coronary thrombosis is usually superimposed.

**NHANES:** National Health and Nutrition Examination Survey; conducted every 10 years by the National Center for Health Statistics to survey the dietary habits and health of U.S. residents.

**Obesity:** The condition of having an abnormally high proportion of body fat. Defined as a body mass index (BMI) of greater than or equal to 30 in adults and greater than or equal to the 95th percentile BMI in children and adolescents. Subjects are generally classified as obese when body fat content exceeds 30 percent in women and 25 percent in men.

**Observational study:** An epidemiologic study that does not involve any intervention, experimental or otherwise. Such a study may be one in which nature is allowed to take its course, with changes in one characteristic being studied in relation to changes in other characteristics. Analytical epidemiologic methods, such as case-control and cohort study designs, are properly called observational epidemiology because the investigator is observing without intervention other than to record, classify, count, and statistically analyze results.

**Orlistat:** A lipase inhibitor used for weight loss. Lipase is an enzyme found in the bowel that assists in lipid absorption by the body. Orlistat blocks this enzyme, reducing the amount of fat the body absorbs by about 30 percent. It is known colloquially as a “fat blocker.” Because more oily fat is left in the bowel to be excreted, Orlistat can cause an oily anal leakage and fecal incontinence. Orlistat may not be suitable for people with bowel conditions such as irritable bowel syndrome or Crohn’s disease.

**Osteoarthritis:** Noninflammatory degenerative joint disease occurring chiefly in older persons, characterized by degeneration of the articular cartilage, hypertrophy of bone at the margins, and changes in the synovial membrane. It is accompanied by pain and stiffness. Can accompany obesity and overweight.

**Overweight:** An excess of body weight but not necessarily body fat; a body mass index of 25 to 29.9 kg/m² in adults, and between the 85th and 95th percentile BMI in children and adolescents.

**Pancreas:** The pancreas is a gland located behind the stomach that produces enzymes essential to digestion. These enzymes are also released into the duodenum when food in the stomach ‘signals’ the start of the digestion process.

**Pharmacotherapy:** The treatment of diseases, including obesity, by the administration of drugs. In obesity-related conditions, a regimen of using appetite suppressant medications to manage obesity by decreasing appetite or increasing the feeling of satiety. These medications decrease appetite by increasing serotonin or catecholamine—two brain chemicals that affect mood and appetite.

**Phentermine:** An adrenergic isomeric with amphetamine, used as an anorexic; administered orally as a complex with an ion-exchange resin to produce a sustained action.

**Physical activity:** Any form of exercise or movement. Physical activity may include planned activity such as walking, running, basketball, or other sports. Physical activity may also include other daily activities such as household chores, yard work, walking the dog, etc. It is recommended that adults get at least 30 minutes and children get at least 60 minutes of moderate physical activity most days of the week. Moderate physical activity is any activity that requires about as much energy as walking two miles in 30 minutes.

**Polyunsaturated fat:** An unsaturated fat found in greatest amounts in foods derived from plants, including safflower, sunflower, corn, and soybean oils.

**Protein:** A class of compounds composed of linked amino acids that contain carbon, hydrogen, nitrogen, oxygen, and sometimes other atoms in specific configurations. Protein is an essential nutrient that helps build many parts of the body, including muscle, bone, skin, and blood. Protein provides 4 calories per gram and is found in foods like meat, fish, poultry, eggs, dairy products, beans, nuts, and tofu.

**Refractory obesity:** Obesity that is resistant to treatment.

**Registered Dietitian (RD):** A health professional who is a food and nutrition expert. A person who has studied diet and nutrition at an American Dietetic Association (ADA) approved college program and passed an exam to become a registered dietitian.

**Relative risk:** The ratio of the incidence rate of a disease among individuals exposed to a specific risk factor to the incidence rate among unexposed individuals; synonymous with risk ratio. Alternatively, the ratio of the cumulative incidence rate in the exposed to the cumulative incidence rate in the unexposed (cumulative incidence ratio). The term relative risk has also been used synonymously with odds ratio. This is because the odds ratio and relative risk approach each other if the disease is rare (5 percent of population) and the number of subjects is large.
**Glossary (continued)**

**Resting metabolic rate (RMR):** RMR accounts for 65 to 75 percent of daily energy expenditure and represents the minimum energy needed to maintain all physiological cell functions in the resting state. The principal determinant of RMR is lean body mass (LBM). Obese subjects have a higher RMR in absolute terms than lean individuals, an equivalent RMR when corrected for LBM and per unit surface area, and a lower RMR when expressed per kilogram of body weight. Obese persons require more energy for any given activity because of a larger mass, but they tend to be more sedentary than lean subjects.

**Restrictive:** The amount of food intake is restricted by altering the digestive system.

**Roux-en-Y bypass:** See gastric exclusion; the most common gastric bypass procedure.

**Saturated fat:** A type of fat found in greatest amounts in foods from animals, such as fatty cuts of meat, poultry with the skin, whole-milk dairy products, lard, and in some vegetable oils, including coconut, palm kernel, and palm oils. Saturated fat raises blood cholesterol more than anything else eaten. A fat that is solid at room temperature. Fats that are in foods are combinations of monounsaturated, polyunsaturated, and saturated fatty acids. Saturated fat is found in high-fat dairy products (like cheese, whole milk, cream, butter, and regular ice cream), fatty fresh and processed meats, the skin and fat of chicken and turkey, lard, palm oil, and coconut oil. They have the same number of calories as other types of fat, and may contribute to weight gain if eaten in excess. Eating a diet high in saturated fat also raises blood cholesterol and risk of heart disease.

**Sedentary behavior:** A pattern of behavior that is relatively inactive, such as a lifestyle characterized by a lot of sitting.

**Serotonin:** A monoamine vasoconstrictor, found in various animals from coelenterates to vertebrates, in bacteria, and in many plants. In humans, it is synthesized in the intestinal chromaffin cells or in the central or peripheral neurons and is found in high concentrations in many body tissues, including the intestinal mucosa, pineal body, and central nervous system. Produced enzymatically from tryptophan by hydroxylation and decarboxylation, serotonin has many physiologic properties (e.g., inhibits gastric secretion, stimulates smooth muscle, serves as central neurotransmitter, and is a precursor of melatonin).

**Skinfold measurement:** Estimation of body fat by measuring thickness of skin from 3 to 9 different standard anatomical sites around the body. The right side is usually only measured (for consistency). The tester pinches the skin at the appropriate site to raise a double layer of skin and the underlying adipose tissue, but not the muscle. The calipers are then applied 1 cm below and at right angles to the pinch, and a reading in millimeters (mm) taken two seconds later. The mean of two measurements should be taken. If the two measurements differ greatly, a third should then be done, then the median value taken.

**Sibutramine:** A drug used for the management of obesity that helps reduce food intake and is indicated for weight loss and maintenance of weight loss when used in conjunction with a reduced-calorie diet. It works to suppress the appetite primarily by inhibiting the reuptake of the neurotransmitters norepinephrine and serotonin. Side effects include dry mouth, headache, constipation, insomnia, and a slight increase in average blood pressure. In some patients it causes a higher blood pressure increase.

**Sleep apnea:** A serious, potentially life-threatening breathing disorder characterized by repeated cessation of breathing due to either collapse of the upper airway during sleep or absence of respiratory effort.

**Small intestine:** Also known as the small bowel, the small intestine is responsible for most digestion and absorption of food—protein, vitamins, minerals, and essential fats. The mixture of digestive juices helps break down the food so that it can be absorbed through the walls of the small intestine and into the bloodstream. The small intestine is divided into 3 sections: the duodenum—the first section and attached to the stomach; jejunum—the middle section responsible for most of the digestion and absorption of food; and the ileum—the third section and attached to the large intestine.

**Social pressure:** A strategy used in behavior therapy in which individuals are told that they possess the basic self-control ability to lose weight, but that coming to group meetings will strengthen their abilities. The group is asked to listen and give advice, similar to the way many self-help groups, based on social support, operate.

**Stomach:** This organ is considered the food ‘reservoir’—storing food and sending it slowly to the small intestine. In the stomach, protein, fats and carbohydrates are partially digested into smaller portions. As food leaves the stomach through another one-way valve, it empties into the small intestine. Normally, the stomach can hold about three pints of food after a single meal.

**Stomach stapling:** A general, generic term that is not used by bariatric surgeons because it tends to be too nonspecific. Many types of bariatric operations involve stapling the stomach.
Glossary (continued)

Stroke: Sudden loss of function of part of the brain because of loss of blood flow. Stroke may be caused by a clot (thrombosis) or rupture (hemorrhage) of a blood vessel to the brain.

Submaximal heart rate test: Used to determine the systematic use of physical activity. The submaximal work levels allow work to be increased in small increments until cardiac manifestations such as angina pain appear. This provides a more precise manipulation of workload and gives a reliable and quantitative index of a person’s functional impairment if heart disease is detected.

Systolic blood pressure: The maximum pressure in the artery produced as the heart contracts and blood begins to flow.

Trans-fatty acids: (trans fats) A fat that is produced when liquid fat (oil) is turned into solid fat through a chemical process called hydrogenation, such as when vegetable oil becomes margarine or shortening. Trans-fatty acids also occur in milk fat, beef fat, and lamb fat. These fatty acids have been associated with increased blood cholesterol levels.

Triglyceride: A lipid carried through the blood stream to tissues. Most of the body’s fat tissue is in the form of triglycerides, stored for use as energy. Triglycerides are obtained primarily from fat in foods.

Type 1 diabetes: Previously known as “insulin-dependent diabetes mellitus,” (IDDM) or “juvenile diabetes.” Type 1 diabetes is a life-long condition in which the pancreas stops making insulin. Without insulin, the body is not able to use glucose (blood sugar) for energy. To treat the disease, a person must inject insulin, follow a diet plan, exercise daily, and test blood sugar several times a day. Type 1 diabetes usually begins before the age of 30.

Type 2 diabetes: Also known as “noninsulin-dependent diabetes mellitus” (NIDDM) or “adult-onset diabetes.” Type 2 diabetes is the most common form of diabetes mellitus. About 90 to 95 percent of people who have diabetes have type 2 diabetes. People with type 2 diabetes produce insulin, but either do not make enough insulin or their bodies do not use the insulin they make. Most of the people who have this type of diabetes are overweight. Therefore, people with type 2 diabetes may be able to control their condition by losing weight through diet and exercise. They may also need to inject insulin or take medicine along with continuing to follow a healthy program of diet and exercise. Although type 2 diabetes commonly occurs in adults, an increasing number of children and adolescents who are overweight are also developing type 2 diabetes.

Unsaturated fat: A fat that is liquid at room temperature. Vegetable oils are unsaturated fats. Unsaturated fats include polyunsaturated fats, and monounsaturated fats. They include most nuts, olives, avocados, and fatty fish, like salmon.

Vertical-banded gastroplasty: A surgical treatment for extreme obesity; an operation on the stomach that involves constructing a small pouch in the stomach that empties through a narrow opening into the distal stomach and duodenum.

Very-low-calorie diet (VLCD): The VLCD of 800 (approximately 6–10 kcal/kg body weight) in adults or fewer calories per day is conducted under physician supervision and monitoring and is restricted to severely obese persons.

Very-low-density lipoprotein (VLDL): The lipoprotein particles that initially leave the liver, carrying cholesterol and lipid. VLDLs contain 10 to 15 percent of the total serum cholesterol along with most of the triglycerides in the fasting serum; VLDLs are precursors of LDL.

Visceral fat: One of the three compartments of abdominal fat. Retroperitoneal and subcutaneous are the other two compartments.

Waist circumference: To define the level at which the waist circumference is measured, a bony landmark is first located and marked. The subject stands, and the technician, positioned to the right of the subject, palpates the upper hip bone to locate the right ileum. Just above the uppermost lateral border of the right ileum, a horizontal mark is drawn and then crossed with a vertical mark on the midaxillary line. The measuring tape is then placed around the trunk, at the level of the mark on the right side, making sure that it is on a level horizontal plane on all sides. The tape is then tightened slightly without compressing the skin and underlying subcutaneous tissues. The measure is recorded in centimeters to the nearest millimeter.

Waist-hip-ratio (WHR): The ratio of a person’s waist circumference to hip circumference. WHR looks at the relationship between the differences in the measurements of waist and hips. Most people store body fat in two distinct ways, often called the “apple” and “pear” shapes, either the middle (apple) or the hips (pear). For most people, carrying extra weight around their middle increases health risks more than carrying extra weight around their hips or thighs. Overall obesity, however, is still of greater risk than body fat storage locations or WHR.
Acknowledgments

This Childhood Obesity Toolkit was made possible through a grant from Covidien.

The Obesity Society gratefully acknowledges the following organizations for their kind permission to reprint or reproduce materials in this Childhood Obesity Resource:

- American Academy of Pediatrics (AAP)
- Blue Cross Blue Shield of Massachusetts
- California Medical Association Foundation (CMA)
- Centers for Disease Control (CDC)
- Let’s Go! (A program of the United Way of Greater Portland, implemented in partnership with The Kids CO-OP at The Barbara Bush Children’s Hospital at Maine Medical Center)
- Maine Center for Public Health (MCPH)
- National Heart Lung and Blood Institute (NHLBI)
- National Initiative for Children’s Healthcare Quality (NICHQ)
- Texas Pediatric Society (TPS)
